The exact cause of milk fever has not been determined, but Dr. J. Schmidt, a Danish veterinarian, points out that the disease may be due to poisonous products derived from tissue changes taking place in the udder, while experience teaches that certain conditions apparently render a cow of the proper age peculiarly susceptible. A few of these aggravating causes are: hot, badly ventilated, filthy stables; heavy feeding upon grain foods (concentrates) right up to the time of calving; lack of exercise; excessive use of succulent foods; sudden plethora induced by new grass in spring; heredity; immediate and complete removal of the first milk produced after calving, or immediate removal of the new born calf.

NATURAL PREVENTION.

It is safe to assert that the disease may be absolutely prevented by the adoption of the following simple, natural methods: Start six weeks prior to calving and feed cow upon dry hay, bran mashes and a little flax seed meal, but no corn, corn meal, shorts, middlings, oat meal, gluten meal, malt sprouts, or any similar concentrate. One month from calving increase the amount of flax seed meal mixed in the bran mashes to insure keeping the bowels freely open. If there is a tendency to constipation, despite the increased amount of oil meal, dissolve two ounces of Epsom salts in the mash or drinking water once or twice daily as required. One week before calving double the amount of oil meal daily, and give at calving, if the cow is costive, one pound of Epsom salts, one ounce of ground ginger root and one ounce of saltpetre with a cupful of molasses in two quarts of warm water, at one dose, slowly and carefully from a long-necked bottle. During all this time the cow is to be given ample out-door exercise daily to keep her blood in full circulation, all the organs of the body in proper order and her muscles full and strong.

This method of preventive treatment applies equally to the susceptible cow whose calf is expected when green grass is in its "spring flush." She is to be kept in a dry yard and there to have the same food and care given the cow about to calve prior to the advent of grass. When calf comes allow it to suckle for 3 days, or draw off some of the milk frequently by hand; do not milk clean at first.

MEDICINAL PREVENTION.

Unless the cow has suffered a previous attack of the disease, predisposing her to a second attack and necessitating larger doses of medicine, it will be found safe and sufficient in average cases to give her as a preventive one-half drachm of iodide of potash twice daily for three days, then three times daily during the week preceding parturition, and two drachms the moment it is observed that she is about to calve. Where the cow is fat she may also have two drachms immediately after parturition. While this plan succeeds, it checks milk flow after calving, hence is somewhat objectionable.

TREATMENT.

Place cow attacked with milk fever in a box stall, or shady place in summer time when out of doors. Prop her up by means of bags filled with straw, so that she must lie on her sternum (breast bone). Keep her head up in same manner. She will soon bloat and die if allowed to lie upon her side. Tap the pouch with trocar and cannula, if she is bloated when found. Give no drenches of medicine by the mouth. Strip away the milk; wash the udder clean with warm water and soap, adding chloro naptholeum to make a 2 per cent solution. This done, place the udder upon a clean rubber sheet, to prevent soiling. By means of a five-foot length of quarter-inch rubber hose, in one end of which has been inserted a large milking tube and the other a glass funnel, infuse very slowly into each teat in turn, half a pint of milk-warm solution of 2 drachms of iodide of potash in one quart of freshly boiled water. Then rub the udder well once an hour, until the liquid is absorbed.

Inflation of the udder with pure oxygen gas gives even better results, than the iodide of potash treatment.

In addition to the above treatment, syringe a gallon of soapy warm water into the rectum every four hours; remove the urine by means of catheter at least twice daily; repeat the infusion of iodide of potash solution, if the cow is not up inside of twenty-four hours. Do not milk in less than six hours. Give by mouth one drachm of fluid extract of nux vomica in a tablespoonful of water every six hours. Turn the cow partly every four hours, so that the hind leg can be pulled forward, and outwards to retain her on her chest. Let her drink when she can do so and feed a soft mash when she becomes conscious. Feed her carefully for a few days and as a rule this will be the last of the treatment necessary.

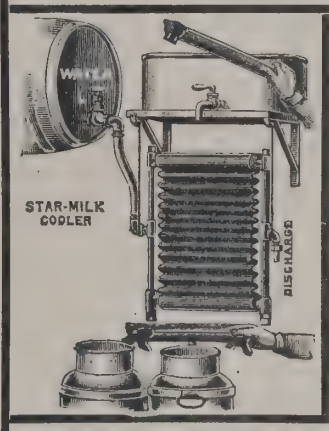
A. S. ALEXANDER, V. S.
Veterinarian, Wisconsin Agricultural Experiment Station.

Treatment for Lumpy Jaw.

In a treatise on lumpy jaw recently issued by the Purdue Experiment Station, the disease is diagnosed and treatment prescribed as follows:

The disease more often affects cattle than other animals. It is due to a fungus—actinomycosis. The fungus occurs upon grass or other vegetation, and it is only when it becomes introduced into the tissues that it causes trouble. The disease comes from eating, outside sources, and is not contagious in the usual sense of the word. Several animals may become affected while on the same pasture, but this is not due to all being exposed alike. Some years the number of cases is greater than others, owing to the greater development of this fungus. The disease affects the jaw more often than other parts, due to the fact that the tissues are sometimes broken in the act of chewing, thus permitting infection. Any part of the body may be attacked.

The disease is comparatively easy to treat. A dram of iodide of potash is given twice a day from two weeks to twenty days. For cattle weighing 2,000 pounds or more, the dose is increased, and lessened for calves. If pus be present in the lump it should be let out by incision. In a few refractory cases a second period of treatment may be required after resting for ten days. About 80 per cent of recoveries may be expected. Affected animals should be kept away from the healthy, and off the pasture fields. In the case of milch cows, the milk should not be used. The state does not pay for such animals when it is found necessary to destroy them.



MOST any man with pen and ink and an elastic conscience can make big claims on paper. What the farmer wants is less "blow" and more "do."

The makers of the EMPIRE CREAM SEPARATOR are not willing to enter into a "bragging match" with their competitors; they feel their weakness in this respect and know that they would be out-classed. They are, however, willing and anxious that every cow owner should thoroughly investigate for himself the merits of the EMPIRE. The more you know about it the better you like it. Our book, "Dairyman's Dollars," FREE.

Bloomfield, N. J. -- Chicago, Illinois.
The EMPIRE'S popularity is the result of worth and merit.

Something You Cannot Do Without
WINTER OR SUMMER

No use in delay. To be a successful dairyman you must start right and you cannot do this without a Cooler, and it is absolutely necessary to have a machine that is guaranteed to do good work for you. A poor Cooler is worse than nothing. . . . .

TRY OURS

There is nothing like it. Send for Cooler Booklet. . . . .

STAR MILK COOLER CO., Haddonfield, N. J.

Do not Cool Your Milk
the old-fashioned way, with a dipper or a paddle, but get an up-to-date
Milk Cooler-Aerator.
Saves Time, Labor, Patience and Money.
A Free Booklet; ask.

THE SIGNAL MAIL BOX
(Bates-Hawley Patent) is the original Rural Service Box. Especially commended by P. M. Gen'l. Full govt. size. Only complete box which meets every need. Write to-day for handsome booklet and our Free Offer
SIGNAL MAIL BOX CO., 367 Benton St.
JOLIET, ILL.

Creasey Ice Breakers

Dairymen and shippers of milk and cream find them most efficient, economical machines, and the greatest savers of time and ice. Easy to operate. Rapid cutters. The design is right.

Made in sixteen sizes to suit every requirement. Send for catalogue "11-B" which gives full particulars.

WILL IT PAY YOU TO TAKE HOARD'S DAIRYMAN?

W. H. Jenkins took a census in 1901 of 50 farmers who were patrons of the creamery in Montrose, Pa. Twenty-five of themread dairy papers; twenty-five did not. The twenty-five who did read dairy papers averaged $50.23 per cow for the year. The twenty-five who did not read averaged $32.95. Here is a difference of $17.28 per cow. Did it pay the twenty-five to read? Did it pay the other twenty-five not to read? That's not all. Those who did read averaged a profit over cost of food of $15.06 per cow. Those who did not read averaged a profit of 66 cents. Is not that dairy farmer standing greatly in his own light who will not pay 2 cents a week for Hoard's Dairyman? These are hard facts worth thinking over.

COMING EVENTS.

Indiana State Dairymen's Meeting, Plymouth, Dec. 10-11, 1903.
Minnesota Dairymen's Association, St. James, Oct. 21-22, 1903.
New York Dairymen's Association, Ogdensburg, Dec. 8-11, 1903.
Vermont Dairymen's Association, St. Albans, Jan. 5-7, 1904.
Illinois Dairymen's Association, Greenville, Jan. 5-7, 1904.
Wisconsin Cheese Makers' Association, Milwaukee, Jan. 6-8, 1904.
Ohio Dairymen's Association, Columbus, Jan. 27-29, 1904.
Wisconsin Butter Makers' Association, Feb. 2-4, 1904.
Maine Dairy Convention at Foxcraft, Me., Dec. 2 and 3, 1903.
New Jersey Agricultural and Dairy Convention, Trenton, N. J., Jan. 14, 15 and 16.
Eastern Ontario Dairymen's Convention, Belleville, Ont., Jan. 5, 6 and 7.
Missouri Dairymen's Meeting, Clinton, Dec. 8-10, 1903.

THE College of Agriculture and Domestic Science of the Ohio State University has opened with the largest attendance in its history. The enrollment is now 206, which is 20 ahead of the enrollment at this time last year and 60 ahead of the enrollment two years ago. The enrollment of the University has increased in proportion and now numbers nearly 1,700 and is likely to reach over 1,900 before the close of the year.

SOME of the dairy and agricultural papers have been telling about the negro, Gilchrist Stewart, being chosen Superintendent of the Dairy Department of the Western Fair of Toronto, Ont., and they have ascribed all sorts of stupendous accomplishments to him, as if he was one of the gods done in ebony. Among the many things the *Dairy World* ascribes to his fertile genius is the discovery that chloride of saltpetre would remove onion, garlic and turnip flavor from butter and cheese. Well, maybe it would, if there was such a thing as chloride of saltpetre. The statement, chemically speaking, and Stewart's character as a man are about alike—neither have any visible means of existence.

THE RAILROADS AND FARM PAPERS.

The railroad men are among the keenest and soundest reasoners in the country. They have to be, for they cannot afford to make mistakes. It is a pity that there are not more farmers who would see their business in the same light.

Advertising Agent Munch, of the Illinois Central R. R., makes the statement that his road finds the farm paper the most profitable to advertise in. He says their business follows that line very closely. They do not make sales of their land to the well established farmers, but rather to the hired men who are thinking of becoming farmers themselves.

And the hired men see and read the agricultural papers taken by the farmers. It is a noticeable fact that good hired men much prefer working for farmers who have plenty of good farm reading on their tables.

INTELLIGENT BREEDING.

The *St. Paul Farmer* mentions the fact that the cattle on the ranches in Montana are superior for beef purposes to the cattle of Minnesota and it asks why this is so and answers the query by saying the Montana ranchman has had better ideas about breeding than the Minnesota farmer. He has had a truer appreciation of the importance of selecting sires that will breed true to the purpose of meat making. The DAIRYMAN would add that take them as they go the beef farmers everywhere are much better students of breeding to a purpose than are the dairy farmers. It is very rarely that we hear a good beef cattle farmer talk about general purpose breeding. If you notice the sire he selects he will always be of the most decided beefy outline.

But there are thousands of dairy farmers who, wanting dairy cows, will go ahead and select bulls of the same beefy type. That shows which side has made the best study of the laws that govern breeding results.

HE WATCHED MEN AND MARKETS.

It seems to be a very difficult matter to arouse the average creamery or cheese factory patron to a realizing sense of how he is losing money in his present ideas of cows and methods. Wherever HOARD'S DAIRYMAN instituted a "cow census" and looked into the actual condition of these men and the amount of dairy knowledge they are doing business with, a very discouraging showing is made—such a large percentage of farmers do not seem to know, nor care to know, what they in reality are doing. We suppose that we ought not to wonder at these men, or feel surprised at the bland contentment they manifest in thus going on year after year keeping cows at a loss. The men who do that, we invariably find, are living on the ragged edge of the business. It will be found that they read scarcely anything about dairying, or in any way enlighten their minds on this dairy question. They do not seem to know any more about it than they did years ago. Mr. A. E. Anderson of Oelwein, Iowa, in the meeting of the North Central Iowa Butter Makers the other day spoke as follows:

"A man from Northfield, Minn., claimed that last year his cows brought him $80 per head and cost him for feed $31.50, leaving him a net profit practically of $50 per cow.

I have watched the markets the past year and observed that butter netted the milk producer about 18 cents, making the value of the year's product of the average cow $24. The cost of keeping such a cow in this state is $21. This left a profit for the average cow of but $3. Of course, there was the calf, which could be sold possibly for $15; but the average cow should produce 250 pounds of butter per year, and with land climbing to the $80 per acre mark, and hired men costing $40 a month, including board and washing, *farmers must work in a different manner if they wish to succeed.* * *

We have not gotten the most out of our cows because we have not known how to feed and care for them."

HOARD'S DAIRYMAN wishes the privilege of adding one more hindrance which has stood in the way of the farmers not getting what they should from their cows in these days of high priced land and labor.

They have not bred their cows for the purpose of more milk, butter or cheese.

They have been deluded with "dual purpose" notions. All through Iowa the farmers have worked under this idea, and the result is the $24-dollar cow Mr. Anderson is complaining about. The average return from the cows of this, Jefferson county, Wisconsin, is 240 pounds of butter per cow, even with too many of our farmers breeding for general purpose. Think what the average would be if they all bred their cows on dairy lines and for the best results at the pail.

Now 240 pounds of butter, at 18 cents, the net price Mr. Anderson names, would amount to $43.20, and we have just as good a chance to make profit from the skim milk as do the Iowa people, and besides we have double the amount of skim milk. The average cost of keeping is $30. Here is a gain of $10 per cow over the Iowa average. The cows of Jefferson county in the main are Jersey, Guernsey and Holstein. They produce over 8,000,000 pounds of butter a year, support 100 creameries, and six cheese factories, and the value of the entire dairy product is about $2,000,000 a year. Does any one suppose that this would be the case if the Jefferson county farmers handled their business from the "dual-purpose" and no-reading standpoint, as do the farmers whose cows average only $24 a year?

A FINE SOUTH CAROLINA DAIRY.

In no branch of agriculture has there been shown such marked progress and advancement toward scientific results, intelligent comprehension of underlying principles, and skillful training as in dairying.

The reason for this we believe to be because of the better organization of the dairy farmers. They have organized county, state and national associations; the conduct of their business is largely through associated effort in creameries and cheese factories. By virtue of such organization, dairy farmers have been reached to a larger extent than other farmers, by all the educational influences of the convention, farm institute, dairy school and the dairy papers.

The spirit of dairying is spreading to all the states in the Union.

People must have good food; they want good butter, cheese, and in particular they want good milk.

This rapidly increasing demand is calling for special outlay of capital and enterprise. A recent number of the *State*, the leading paper of South Carolina, contains an illustrated description of the up-to-date dairy farm and herd of Mr. F. H. Hyatt near the city of Columbia. Cuts are shown of the dairy house, the herd, and the fine dairy barn 150 ft. long and 30 ft. wide. The farm consists of 1,100 acres, two-hundred and fifty of which is Bermuda grass, The herd numbers 80 mature cows, made up of Jerseys, Devons and Holsteins. Especial care is taken to keep the establishment clean and in a sanitary condition. Each morning each cow is carefully groomed. Mr. Hyatt points to practical results of keeping clean, in the fact that for six years he has not loss a single cow by death. He grazes his cattle from March to November and by planting oats and rye can graze the cows fully 10 months. It costs while grazing about 5 cents a day to keep the stock and in winter about 15 cents a day. The average value of the cows is $45 to $50 a piece.

The farm is carried on with six first-class men as help. The daily output of milk is 500 quarts, which retails in the city at $1 for 12 quarts, by the pint; $1 for 14 quarts by the quart, and $1 for 16 quarts by the gallon. Mr. Hyatt states that such is the demand that he could easily dispose of the milk of 300 cows. Whatever butter is made sells for 25 cents a pound. A sterilizing plant will be shortly put in. Concerning the profits of the business, Mr. Hyatt says:

"I know of nothing that pays better. Any man can make 15 per cent on his money, besides the natural increase in the valuation of the farm resulting from the manuring that is constantly going on. My farm has now reached that point of development where I do not have to buy any more cows, raising all I need, and consequently is now more profitable than it was at the start."

It is a very encouraging sign to see these first-class dairy farms being established in the South. North or South there is no difficulty in carrying on a successful dairy business if the man at the head of it will but comprehend the old maxim, "knowledge is power,"

A SUCCESSFUL OHIO DAIRY.

Wise men and wise dairying are not confined to any one state. Indeed, there are enough of such examples to convince us that there is no special "dairy belt" except in the brains of these successful men. The *Ohio Farmer* publishes the following business showing for a year of the farm and dairy of Mr. J. C. Stalton, of Columbia Co., Ohio. There are 94 acres in the farm and an average dairy of 24 registered Jersey cows.

RECEIPTS FOR THE PAST YEAR.

Milk delivered at the Winona creamery	$1,629.80
Curd from the milk	149.11
Hogs sold during the year	438.50
Clover seed and hay	247.00
212 bu. of wheat	151.40
Calves	95.00
Apples, potatoes, etc	161.59
Maple syrup	45.36
Poultry	50.00
Received for workof teams and hands	256.00
Milk for two families, truck from patches	60.00
Total farm income	$3,283.76

EXPENDITURES.

Farm labor	$560.00
Cow feed, gluten and oil meal	286.00
Feed for hogs and horses	209.88
Taxes	32.76
Farm papers	2.70
Blacksmithing, horseshoeing, etc	25.80
Seeds, ensilage, seed corn and alfalfa	18.35
Ensilage cutting and threshing	47.00
Binder twine	13.00
Coal for engine	2.12
Fertilizers	46.00
Incidentals	27.80
Total farm expense	$1271.41

SUMMARY.

Income	$3,283.76
Expense	1,271.41
Balance	$2,012.35

CAPITAL.

94 acres land	$6,000
Live stock and equipment	3,000
Total valuation	$9,000

The net income would be 22⅓ per cent on the investment. The following items of information concerning the methods followed are given. The cows were milked for the creamery. Therefore, they are to be reckoned as creamery cows. The average return per cow is $74.12 The boughten grain fed these cows was $11 each. Total cost of keeping for the year is put at $23. It will be noted that this fine showing of net profit of $51.12 per cow was made from Jerseys, the cow that so many farmers will not have on their farm because they are troubled with fear that after earning about double what their general-purpose cows do for a series of years they would lose a few dollars on her old carcass in beef. Not only does Mr. Stratton have fine cows, but a silo also. He cuts and stores his ensilage at 50 cents a ton; cost of growing the crop $4 an acre and $3 more as land rentals, or a total cost 70 cents a ton, making the entire cost of the ensilage $1.20 per ton. The cost of producing his butter was 8 cents per pound.

A SIGNIFICANT CONTRAST.

Former Governor Adams of Colorado, who was born on a Wisconsin farm and educated in Wisconsin schools, in an address before a horticultural convention made a statement as true as it was startling when he said:

"The twentieth century will be known as the age of irrigation of gardens and orchards. The benefactors will be those who discover or develop a new root, fruit or food. He who finds a new vegetable or a new apple is great-

er than he who invents a new dynamite, a new gun or a battleship. I would rather develop a new Jonathan, a Winesap. a Baldwin, or even a Ben Davis, than be a senator or win a great battle. The man who gave us the Early Rose or Burbank potato has done a hundredfold more than the astronomer who finds a new star, or the explorer who plants a flag at the north pole."

A Wisconsin Bulletin on Milk Production.

It is encouraging to see that the experiment stations are giving up the one, two and three week feeding periods, and acknowledging the fact that a cow is not a machine that can be switched from one track to another by the turning of a crank or change in the food given. There is no doubt that a large amount of experimental work is of little value on account of the short period through which the experiment has been carried. In fact the present indications seem to be that one if not more lactation periods are necessary to establish the influence of food upon milk production or its action on the nutrition of the animal. The bulletin on milk production issued by the Wisconsin Station is the work of Prof. W. L. Carlyle and F. W. Woll, and gives in detail the history of the University dairy herd from the time of its organization, in November, 1898, to May of the present year.

During all this time accurate records of food consumption and milk production have been kept and each cow has been credited with whatever profit she has made. The herd is composed of animals representing the various types of dairy and dual-purpose cattle, and so offers an opportunity for study and comparison that could never be secured in an ordinary herd.

The bulletin is summarized by the authors as follows:

1. The average yield of milk for the various cows in the herd ranged from 10,960.3 to 4,033.0 pounds; the production of fat ranged from 474.73 to 183.64 pounds, and the net profit returned by the cows from $79.31 to $19.59. The highest average production per year for any cow in the herd was that of the Jersey cow, Gold, which is credited with a production of 7,621.6 pounds of milk and 474.73 pounds of butter fat, and a net profit (value of butter and skim milk minus cost of food) of $79.31. This cow also produced the maximum amount of butter fat of any cow in the herd during 365 consecutive days—viz: 502.12 pounds, and returned the highest net profit of any cow during this time, with $84.55. Twenty-two of the cows produced more than 300 pounds of butter fat per year on the average, and twenty-five out of the total number of thirty-eight cows yielded a profit of $40 or more over the cost of the food eaten.

2. The average production of ten cows during their year of maximum production was 376.51 pounds of butter fat, and their average net profit $58.21. During the year following their maximum production the same cows yielded on the average 281.47 pounds of butter fat and a net profit of $40.82. Cows making exceptionally high records for a single year are almost certain to require a portion of the succeeding year for recovery, and will therefore give a much smaller production and lower net profit for that year.

3. Cows belonging to the different breeds represented in the herd yielded on the average as follows:

	Lbs. butter fat per year
Red Polled (one cow)	461.81
Holstein (five cows)	351.62
Guernsey (nine cows)	319.35
Jersey (twelve cows)	301.31
Short horn (eleven cows)	281.73

The average net profit returned by cows of these breeds decreased in the same order from $56.70 (Red Polled) to $36.09 (Short-horn.)

4. The cows in the University herd may be considered as representing three different types of cows, viz., extreme dairy type, large dairy type, and dual-purpose type. If the results for cows of the same type be averaged, we find that the large dairy cows lead in average annual production of fat with 325.23 pounds, the extreme dairy cows being next with 310.21 pounds, and the dual-purpose cows last with 292.99 pounds. The rank of the cows, according to net profit returned, decreased in the same order, from $45.31, for the large dairy cows, to $37.82 for the dual-purpose cows.

In the opinion of the authors, cows of the large dairy type of the particular breed suiting the fancy of the farmer and weighing, say 1,000 pounds or more, will, everything considered, be found the most satisfactory for the dairy farmer; cows of the dual-purpose type, on the other hand, are to be recommended for farmers who wish to utilize more or less of the rough feed produced on their farms for raising beef for the market, in conjunction with keeping a number of cows for milk production. It is not, in our opinion, the part of wisdom for our dairymen to select small, refined cows with a spare habit of body in an extreme degree as the most desirable type of dairy cow.

Cows of exceptional merit as producers were found within all the different types or breeds represented in our herd; the main reliance in selecting cows for the dairy herd should, therefore, be placed not on any particular type or breed, but on individual excellence for dairy purposes. The best indications of true merit in dairy cows are a digestive capacity as evidenced by great depth and length of body and a general refinement in conformation as shown by fineness of bone in the legs, a clean-cut feminine head, a long and fine neck, light shoulders, prominent backbone, a fine, elastic quality of udder, and a well developed milk vein system. Minor points are fine, silky hair, thin, unctuous and movable skin, large, bright eyes, and a general sprightly appearance.

6. The milk produced by the cows decreased somewhat in quality with advancing age. The average per cent for the year with cows in our herd came as follows: 1st year, 4 49 per cent; 2d year, 4.40 per cent; 3d year, 4.29 per cent, and 4th year, 4.17 per cent.

7. The flow of milk decreased, on the average, for all cows in our herd and for four years, with 8 per cent for each month during the progress of the lactation period, and the production of butter fat decreased with 7.3 per cent for each month.

8. Our dual-purpose cows maintained their flow of milk during the progress of the lactation period, as well or better than cows of the dairy types. The shrinkage in the production of milk between the third and the fortieth weeks of the lactation period for the same cows was 44 per cent for the extreme dairy cows, 59 per cent for the large dairy cows, and 49 per cent for the dual-purpose cows, and in the production of fat for the same types of cows 43, 60 and 46 per cent, respectively.

9. The rations fed to the best producers in the herd during the winter periods contained, on the average, 25.28 pounds of dry matter, 2.05 pounds of digestible protein, 15.22 pounds of digestible carbohydrates and fat, and had a nutritive ratio of 1:7 4. The low producing cows received on the average, 21.14 pounds of dry matter, 1.59 pounds of digestible protein, and 12.20 pounds of carbohydrates and fat (nutritive ratio, 1:7.8), while intermediate figures were obtained for the cows with a medium production.

10. Only ten cows out of a total of thirty-three required more than 2 pounds of digestible protein in their average daily winter rations under our system of feeding for a large and economical production. The case of the cow Ella, weighing 1,000 pounds, is especially worthy of note, from the fact that she received only 1.48 pounds of digestible protein per day in her winter ration, and 12.19 pounds of digestible carbohydrates and fat (nutritive ratio 1:8.2), and produced 343 pounds of butter fat yearly, as the average for four years.

According to our present knowledge, we believe that only cows of large capacity will give economical returns for a supply of more than 2 pounds of digestible protein per day, under the conditions present in the northwest, and in the majority of cases, with good average dairy cows, a supply somewhat less than this may be found most economical.

Alfalfa Queries by Mr. Grote.

Will Alfalfa Succeed on Well Drained Wisconsin Marshes.

ED. HOARD'S DAIRYMAN:—Bulletin No. 76 of the Illinois Experiment Station gives as the result of their experiments, and the experiments executed under their supervision, in regard to alfalfa the following facts:

1. Successful alfalfa fields exist in river bottoms as well as on upland, in Illinois.

2. Where alfalfa culture is unsuccessful no alfalfa bacteria are in the soil and by inoculating the alfalfa fields with these bacteria the unsuccessful fields become successful.

3. The application of lime will increase the product by neutralizing the acidity of the soil.

4. Where soils have little or no phosphates and potassium, the addition of these fertilizers will increase the crop and assist in the growing of the necessary bacteria in the soil.

5. Alfalfa requires an abundance of nitrogen, more than any soil can furnish, and the bacteria are necessary to enable the plant to collect the nitrogen from the air, and where the soil is fully impregnated with such bacteria, no nitrogen should be furnished to the soil, as it is wholly unnecessary.

On the established facts the following conclusion is based:

"It is practically certain, that, if inoculated with the proper bacteria alfalfa can be successfully grown on any Illinois soils which grow corn and red clover well."

If this is so, then all well drained marshes would grow good alfalfa if properly limed and supplied with potassium.

Bulletin No. 68 of same Station, states that the Crystal Carbonate Lime Co. of Elsberry, Missouri, offers fine, ground limestone at $1 per ton, loaded in the R. R. car at Elsberry, Missouri.

Now as the river bottoms, subject to overflow, and any lands fit for corn and clover in Illinois produce alfalfa at the rate of 10 tons of hay per acre, I would like to know:

1. Have we any evidence that equal results have or can be obtained in Wisconsin, particularly on marsh soil, properly drained.

2. Have we any factory in Wisconsin at which lime can be obtained for the same price as in Missouri?

From the experiments in Illinois, it seems that the inoculating of the soil is the only thing necessary and this brings another question:

Where can soil be obtained in Wisconsin filled with bacteria to be used for inoculation of other soils?

Mauston, Wis. CHARLES C. GROTE.

What is not known about the growing of alfalfa in Wisconsin and other northern states would make a large book. One of the matters known is that alfalfa flourishes in localities and soils, where a few years ago it was said it could not be profitably grown. It is quite generally believed at the present time that alfalfa cannot be expected to succeed on soil when the permanent ground water comes within eight feet of the surface. Put in the form of a maxim this belief is phrased, Alfalfa will not tolerate wet feet. Perhaps it remains for Mr. Grote to experiment in a small way with alfalfa, on a well drained Wisconsin marsh. The editor of HOARD'S DAIRYMAN will be glad to furnish him with a few pounds of "infected soil" to enable him to prosecute such an experiment, or he can probably obtain a pure culture of alfalfa bacteria from the Department of Agriculture at at Washington.

We do not know of any place in Wisconsin, where lime can be bought at price named.

INQUIRIES AND ANSWERS.

Every inquiry must be signed with the name, Post-office and state of writer. Condense the questions into plain specific inquiry. Be careful to note if your questions have not been answered in replies to others. We are glad to answer all the pertinent questions that we can concerning machinery. Look over our advertising columns and write to the advertisers.

Malt Sprouts.

I am writing you for information regarding malt sprouts, and whether it would be better to use in a balanced ration than bran. It is a feed that has never been used in this country to my knowledge, and I am ignorant as to its feeding quality and composition. Have been told it was supposed to take the place of bran, and that it was cheaper. Please give me some light on the subject, and also the names of firms where I could buy it. Would you advise malt sprouts or bran to use with the following to make a balanced ration: corn and cob meal, cotton seed meal, or gluten feed? Our herd is composed of twenty-six Holsteins. Please formulate a balanced ration that you would consider the best from the above feeds, bran, clover hay, stover and ensilage included. L. E. L.
Springport, Mich.

Malt sprouts usually lack somewhat in palatability and hence can be fed in limited amounts only, say 3 to 5 lbs. daily. As we are not advised concerning the location of malting plants in Michigan, we are unable to say where this correspondent could obtain malt sprouts to best advantage. If not to be had from some plant in his immediate vicinity, they could probably be obtained from Milwaukee, Chicago or Detroit in carloads, at a price which would justify their use. For relative feeding value of bran and malt sprouts consult table on page 772, which shows malt sprouts to be much higher in digestible protein than bran, and lower in fat. In total digestible units, reducing fat to its equivalent in carbohydrates, there is no material difference in the two feed stuffs, bran showing 58% and malt sprouts 59.5%.

The following combination should make a satisfactory average ration:

FORMULA FOR RATION.	*Dry Matter.*	*Digestible Nutrients* Protein.	Carbohydrates	Ether Extract
30 lbs. silage	7.92	.39	4.20	.21
8 lbs. clover hay	6.78	.54	2.86	.14
6 lbs. stover	3.58	.10	1.94	.04
4 lbs. malt sprouts	3.59	.74	1.48	.07
4 lbs. corn and cob meal	3.56	.26	2.52	.14
Totals	25.43	2.03	13.00	.60

One Quarter of Heifer's Udder Defective.

I have a very fine heifer that is making a very nice udder, but the one front quarter does not fill out the least bit. I have milked it some so as to excite the milk organs of that quarter so it might fill up after all. She is due to calve about the middle of February next. E. S. S.
Jonestown, Pa.

Nothing is more effective in cases of this character than persistent, continued massage. It is not enough simply to rub the udder, but it should be gently kneaded and rolled under and between the hands. A liniment of lard and alcohol may be applied and thoroughly rubbed in, but after all the main reliance must be massage.

Schmidt Treatment (Iodide of Potasssium) for Milk Fever.

Where can I get the Schmidt treatment for milk fever in cows, as our local druggists do not keep it, and claim they cannot find it listed?
Albion, Mich. J. A. R.

The Schmidt treatment consists in the use of iodide of potassium, which can be obtained at any drug store. See article on milk fever this issue.

Stabling Dairy Cows Loose.

Will you please answer through your paper the following question: What do you think of stabling dairy cows loose, tying in stanchions while being fed and milked; the cows to be dehorned and the stable kept well bedded? L. E. U.
Afton, Wis.

We have had no expérience with dehorned cattle, and therefore cannot answer with very much satisfaction even to ourselves. We know it is claimed that such a plan works very well indeed with fattening steers, only, as we understand the descriptions given, the steers are fed as well as housed in common. We confess to considerable apprehension that in a herd of cows turned loose in a large pen, some of the least belligerent would be kept in more or less fear much of the time, and if such should be the case, that would not be conducive to best results at the pail. At Wauwinet farm, near Boston, where Mr. Ellis is meeting with unusual success with cows, his superintendent, Mr. Van Norman, is very favorably impressed with the plan of giving each cow a small box stall for constant use.

The Editor's Method of Making Alfalfa.

Give a detailed description of your method of making alfalfa hay, including time of cutting, size of cocks, method of holding caps down, etc.
Afton, Wis. L. E. U.

This question will be found pretty fully answered on page 774. The hay caps there mentioned are preferably 40 inches square, although 36 inches square answers a good purpose. Common sheeting, of medium quality, is the kind of cloth used. The caps are held in place by a light weight at each corner. The senior editor uses the half of an old horse shoe for a weight, fastened to the corner with a piece of stout twine. Any other thing weighing perhaps 6 to 8 ounces, will answer every purpose. In fairly good hay weather, the writer of this reply would not open the cocks until just before hauling the hay to the barn, but in this, as in so many other particulars, the man on the ground must think, judge and act for himself. If the weather is cold and damp, the wilted alfalfa will not heat and sweat as readily as in warmer and fair weather, and in consequence the hay will not cure. Open the cocks to the sun and thus gain the necessary warmth, and when again cocked up the curing process will go on. So in the matter of size of cocks, current circumstances must be considered. In cool, damp weather, the size may be larger than in dry and hot weather.

A Stable Plan Criticised.

I am about to build a cow barn on the east side of a hay barn and to be on a grade with the hay barn. The new building is to be 16x60 and I wish to accommodate twelve cows and use the balance of the room for box stalls.

I propose to have a feeding alley four feet wide, two feet for feeding box, four feet and six inches platform, fourteen inches for gutter and the balance of width about three feet, four inches for alley in rear of cows. Shall have four windows in the east side to light the barn and about seven feet for height of ceiling over cows.

Will you please criticize the arrangment suggested above? How far apart should the cows be placed if swing stanchions are used, and how far apart if cow ties are used? F. H. W.

Michigan

We suggest at least six windows instead of four. This stable being on the east side of the hay barn must necessarily get all the light and sunshine from the east side, and therefore cannot have too much of either of these. Get good sized windows and space them about evenly.

Instead of allowing 4 feet width for feeding alley, thereby curtailing the space behind the cows, we would cut this down to 3 feet and suggest dispensing entirely with feeding boxes. This is a very radical departure from common custom and one that doesn't appear, at first, plausible. Much against his own judgment, the present writer was induced to try this plan for a few cows in his stable, and it worked so satisfactorily that, after a few weeks all the mangers or feeding boxes were removed and the cows fed both hay and grain for some time on the level floor. Later on, wishing to provide for watering cows in the stable, he introduced a V trough in front of the cows and raised the feeding alley, or walk, level with the edge of the trough. We show in this issue a cross section for a stable floor showing the manner of putting in this trough, and also showing a new style of gutter.

For cows weighing 1,000 pounds, or more, 3 feet 6 inches is probably none too much space to allow for each cow. For smaller cows this space may be reduced, and for 800-pound cows 3 feet would probably be ample. It is immaterial whether cows are fastened with swinging stanchions or tied with ropes or chains about the neck, so far as stall room is concerned, but in either event we don't hesitate to advise putting in a partition of some kind, between each two cows. There is quite as much necessity for a partition between cows, as for one between horses. It is, perhaps, largely immaterial what sort of a partition is built. The present writer prefers a swinging partition of some kind, hinged to the frame which carries the stanchions, or separates the standing platform from the feeding alley, and given a little pitch so that it will normally hang at right angles with the gutter. You may connect these partitions with ropes or chains, or they may be left entirely loose if the cows are fastened at the neck.

A very important matter, but one almost universally neglected, is to provide for the admission of fresh air and the withdrawal of foul, cold air. It would seem to need no argument to convince an intelligent man that his cows need pure air to breathe, as much as he does, in order to promote health and vigor. On page 773 *ante* is a little diagram showing the proper method of introducing air. To remove the cold, foul air, build a flue at the most convenient point.

A Massachusetts Ration.

Our cows are mostly grade Jerseys and we sell cream. We have no ensilage or roots, but feed good mixed hay, clover and red top and grain.

Will you please tell me what would be the best ration we could make up from the following grain we can buy here; Corn meal, ground oats, Quaker dairy feed, bran, Buffalo gluten feed, cotton seed meal. We have tried the following rations per day: 2 lbs. bran, 2lbs. ground oats, 1 lb. gluten feed,—2 lbs. bran, 2 lbs. Quaker dairy feed and 1lb. cotton seed meal.

Are these rations heavy enough for cows fed plenty of hay, and giving from 16 to 20 lbs. of quite rich milk per day? How much heavier could we feed without injuring the cows?

Abington, Mass. S. B. R.

A cow of ordinary size ought not to be required or expected to eat and digest daily more than about 20 lbs. of hay or its equivalent in other roughage. This will furnish from 16 to 18 lbs of dry matter and she may safely be fed 8 lbs. of grain in addition bringing the total dry matter up to 23 to 25 lbs. If this amount of grain causes the cow to lay on unnecessary flesh, or if for any reason she does not properly respond at the pail, feed less. Extra large producers, of strong constitutions, may take more than 8 lbs. of grain, if it is not too concentrated, without injury, but just where the limit is, as regards profit or safety, no one can tell in advance.

In the absence of silage and roots, we incline to think 1 lb. old process linseed

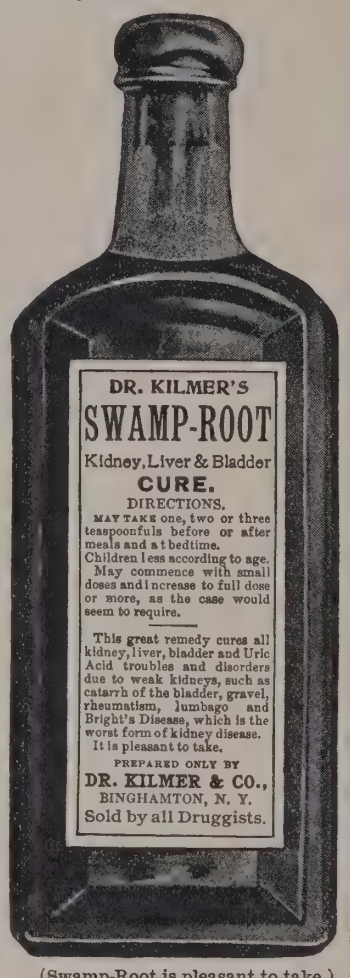
ARE YOUR KIDNEYS WEAK?

Thousands Have Kidney Trouble and Never Suspect It.

To Prove What the Great Kidney Remedy, Swamp-Root, Will Do for YOU, Every Reader of Hoard's Dairyman May Have a Sample Bottle Sent Absolutely Free by Mail.

It used to be considered that only urinary and bladder troubles were to be traced to the kidneys, but now modern science proves that nearly all diseases have their beginning in the disorder of these most important organs.

The kidneys filter and purify the blood—that is their work.



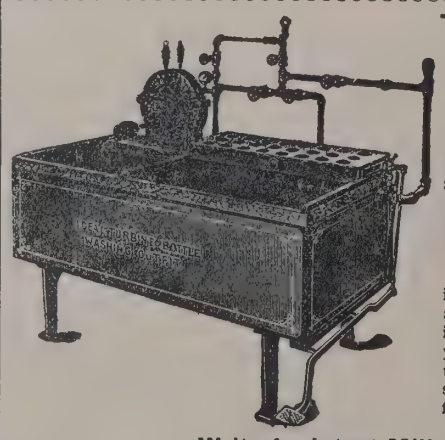
Therefore, when your kidneys are weak or out of order, you can understand how quickly your entire body is affected, and how every organ seems to fail to do its duty.

If you are sick or "feel badly," begin taking the great kidney remedy, Dr. Kilmer's Swamp-Root, because as soon as your kidneys are well they will help all the other organs to health. A trial will convince anyone.

Weak and unhealthy kidneys are responsible for many kinds of diseases and if permitted to continue much suffering with *fatal results are sure to follow*. Kidney trouble irritates the nerves, makes you dizzy, restless, sleepless and irritable. Makes you pass water often during the day and obliges you to get up many times during the night. Unhealthy kidneys cause rheumatism, gravel, catarrh of the bladder, pain or dull ache in the back, joints and muscles; makes your head ache and back ache, causes indigestion, stomach and liver trouble, you get a sallow, yellow complexion, makes you feel as though you had heart trouble; you may have plenty of ambition, but no strength; get weak and waste away.

The cure for these troubles is Dr. Kilmer's Swamp-Root, the world-famous kidney remedy. In taking Swamp-Root you afford natural help to Nature, for Swamp-Root is the most perfect healer and gentle aid to the kidneys that is known to medical science.

If there is any doubt in your mind as to your condition, take from your urine on rising about four ounces, place it in a glass or bottle and let it stand twenty-four hours. If on examination it is milky or cloudy, if there is a brick-dust settling, or if small particles float about in it, your kidneys are in need of immediate attention.



(Swamp-Root is pleasant to take.)

Swamp-Root is pleasant to take and is used in the leading hospitals, recommended by physicians in their private practice, and is taken by doctors themselves who have kidney ailments, because they recognize in it the greatest and most successful remedy for kidney, liver and bladder troubles.

If you are already convinced that Swamp-Root is what you need, you can purchase the regular fifty-cent and one dollar size bottles at the drug stores everywhere. Don't make any mistake, but remember the name, Swamp-Root, Dr. Kilmer's Swamp-Root, and the address Binghamton, N. Y., on every bottle.

EDITORIAL NOTE—You may have a sample bottle of this wonderful remedy, Swamp-Root, sent absolutely free by mail, also a book telling all about Swamp-Root, and containing many of the thousands upon thousands of testimonial letters received from men and women who owe their good health, in fact their very lives, to the great curative properties of Swamp-Root. In writing to Dr. Kilmer & Co., Binghamton, N. Y., be sure to say you read this generous offer in the Fort Atkinson HOARD'S DAIRYMAN.

WHEN YOU SEND IN YOUR RENEWAL, SPEAK TO A FEW OF YOUR NEIGHBORS AND HAVE THEM JOIN YOU. CLUB RATES: 2 Subscriptions, $1.50; 3 Subscriptions, $2.00; 4 Subscriptions, $2.50; 5 Subscriptions, $3.00.

THERE ARE PROBABLY MANY GOOD THINGS
THAT YOU NEED and ought to have, but don't know it.

Here is one of them:

OUR Ideal Turbine Bottle Washing Outfit

We have condensed a whole lot of good things into this outfit. Just packed them up from all around your milk depot and compressed them into one convenient piece of apparatus. Here you have washer, rinser, sprayer, and washing tanks all within easy reach. This is only one of several specialties we have in this line. Our information in this line is yours for the asking.

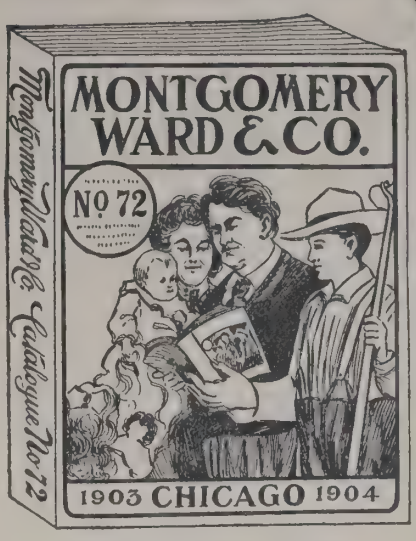
Our New Catalogue
is Now Ready

Catalogue No. 72, fresh from the printing presses and containing more goods that are really up-to-date and of the very latest style and design than any other six catalogues published, is now ready for distribution.

It will save you money on everything you buy and enables you to make your selections as readily and satisfactorily as if you could come to Chicago every day. It puts you in direct touch with the great markets of the world and places before you a stock of first-class goods more complete in every detail than has ever before been offered by any firm and at prices that are positively the lowest, when the reliable quality of the merchandise is taken into consideration. This catalogue contains over 1100 pages of quotations on reliable merchandise of every description. No matter what you may need, you will find the article fully described and illustrated in our great book at a price that no shrewd buyer should overlook.



More than 2,000,000 people sent us orders last year — many of them were your neighbors. They gave us their business simply because we sold them reliable goods for less money than they could buy the same goods for elsewhere and at the end of the year found that they had made an average saving of 25 per cent on their purchases. If your neighbors find it to their advantage to trade with us, why can't you? If you have never traded with us, now is the time to begin. The experiment will cost you only 15 cents. It may result in a saving of hundreds of dollars the first year.

Catalogue No. 72 Contains

17,000 pictures of the things we describe, 70,000 prices on them. The prices are the lowest wholesale prices on the market.

Everything

From Farm Machinery to Trowels.
From Wagons to Baby Carriages.
From Team Harness to Buckles.
From Pianos to Mouth Organs.
From Sewing Machines to Needles.
From Power Pumps to Hand Pumps.

oil meal could be added to the grain allowance specified by our correspondent, partly to add more protein to the ration and partly to secure better digestion and assimilation. There is but little difference in the analysis of the two combinations of grain mentioned,—so little in fact that the question of cost would determine our choice.

An Alfalfa Question.

ED. HOARD'S DAIRYMAN:—I have a farm at Gustavus, Trumbull Co., Ohio, and I am anxious to experiment with about one acre of alfalfa. The piece of ground which I contemplate using raised corn this year, and I would like to have your judgment as to plowing it this fall or whether it had better be done next spring.

2. What kind of manure or fertilizer would you recommend and how much to the acre?

3. Would it make any difference from what locality I purchased the seed?

4. Would it do to secure an infected soil this fall and keep it through the winter and sow along with the grain, or would it be better to buy it in the spring about the time for sowing alfalfa seed? The soil is a somewhat heavy clay subsoil and the general impression in that vicinity is that alfalfa would not amount to anything owing to its winter killing. I am, however, anxious to experiment for myself and am willing to take all the risk in this direction. F. N. BEACH.

Rochester, N. Y.

1. It can be plowed this fall, but first give it a good dressing of manure; then next spring disk it thoroughly both ways and thoroughly harrow to make a fine seed bed.

2. It would be well to dress it next spring with, say, 300 lbs. of sulphate or muriate of potash, or 30 bushels of wood ashes.

5. Would prefer seed from the eastern slope of the Rocky Mountains, say northern Nebraska.

4. If your land grows red clover well you do not need any infected soil. Otherwise it might be well to sow 300 lbs. of such soil to the acre next spring.

The Source of Fat in Milk.

It Is Hard to Tell Where it Does Come From.

New York Experiment Station Bulletin No. 132 affords the following conclusions of experiments:

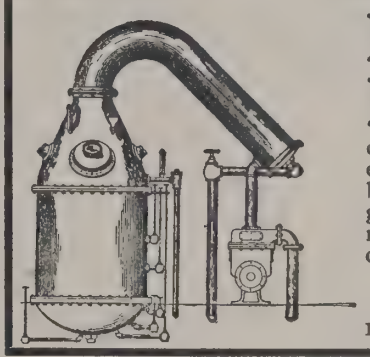
First—A cow fed during ninety-five days on a ration from which the fat has been nearly all extracted, continued to secrete milk similar to that produced when fed on the same kinds of hay and grain in their normal condition.

Scond—The yield of milk fat during the ninety-five days was 62.9 pounds. The food fat eaten during this time was 11.6 pounds, 5 7 only of which was digested. Consequently, at least, 57.2 pounds of the milk fat must have had some other source than the food fat.

Third—The milk fat could not have come from previously stored body fat. This asserion is supported by three considerations. (1) The cow's body could have contained scarcely more than sixty pounds of fat at the beginning of the experiment. (2) She gained forty-seven pounds in body weight during this period of time with no increase of body nitrogen, and was judged to be a much fatter cow in the end. (3) The formation of this quantity of milk fat would have caused a marked condition of emaciation, which, because of an increase of body weight, would have required the improbable increase in the body of 104 pounds of water and intestinal contents.

Fourth—During fifty-nine consecutive days 38 8 pounds of milk fat were secreted, and the urine nitrogen was equivalent to 33.3 pounds of protein. According to any accepted method of interpretation not over seventeen pounds of fat could have been produced from this amount of metabolized protein.

Fifth—The quantity of milk solids secreted bore a definite relation neither to the digestible protein eaten nor to the extent of the protein metabolized. In view of these facts it is suggested that the well-known favorable effect upon milk secretion of a narrow nutritive ratio is due in part to a stimulative, and not wholly to a constructive function of the protein.



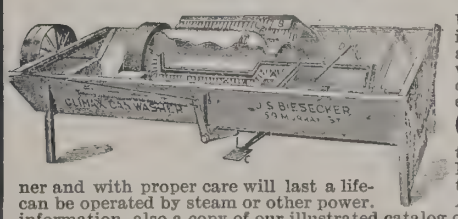
Sixth—The composition of the milk bore no definite relation to the amount and kind of food.

Seventh—The changes in the proportion of milk solids were due almost wholly to changes in the percentage of fat.

Investigation on the Weight of Hay.

ED. HOARD'S DAIRYMAN:—The Agrostologist of the United States Department of Agriculture is undertaking to investigate the subject of the weight in a given volume of hay under different conditions, and would be glad to get into communication with anyone who will be baling hay from the stack or from the mow any time this fall or during the coming winter. In writing to us please state what time the baling will be in process. W. J. SPILLMAN, Agrostologist.

U. S. Department of Agriculture, Washington, D. C.



Milk Condensing Machine

I supply the most improved machinery and most successful processes for manufacturing all classes of condensed milk and evaporated cream. Factories built complete, put in operation and results guaranteed. If you are interested write for my new illustrated and descriptive catalogue. The only catalogue ever published on the subject.

Barn Plan for Kansas Dairyman.

ED. HOARD'S DAIRYMAN:—Would you kindly give through your columns a drawing of a cow stable for 22 cows, a few young calves and small grain bin? Kindly give dimensions in feet for floor for cows, gutter, feeding alley and space back of cows, feeding alley in center, for carpenter to go to work on. Cost should not exceed $250, with hay loft on tight floor above.

Would like to hear from a successful creamery patron in the state of Kansas, that feeds his cows ensilage through the winter.

A CREAMERY OPERATOR FOR THE INTEREST OF 83 PATRONS.

Kansas.

The limit of cost given above must be some slip of the pen. Surely no one expects to build a barn and stable for 22 cows for $250.00. Possibly it might be done for $1,250, not counting the assistance rendered by the owner.

In the cuts made to accompany this answer, we have made provision for a barn floor on level with the stable, on the assumption that it will not be practicable in all places to set the barn in a bank and thus make access to the second floor easy. We also assume that when one starts in to build a new barn he ought to provide ample room for getting about comfortably. The extra expense of a building 32 or 34 feet wide over what it would cost to build only 28 feet is comparatively trifling, especially when considered in connection with the greatly increased convenience.

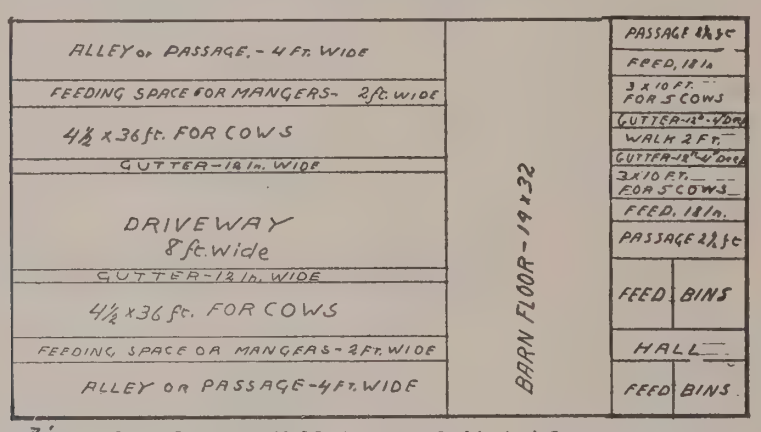

Fig. 1.-FIRST FLOOR OF STABLE--SCALE-1 Inch-4 Feet. Hoard's Dairyman

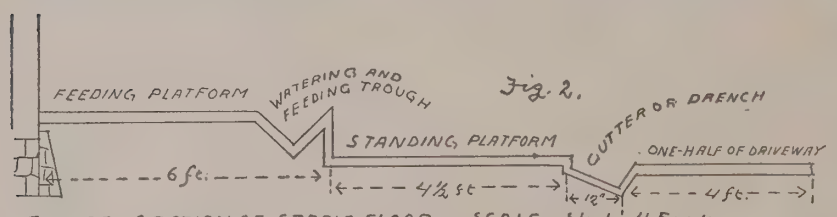

Fig. 2.

CROSS SECTION OF STABLE FLOOR-- SCALE- 1 Inch-4 Feet.

We have planned the stable for cows to face the walls, and not for a central feeding alley, as we think that the better way. It is certainly more sanitary for the cows, and in our opinion more convenient for doing the work.

Our plan calls for a structure 32 feet wide and 60 feet long. If the space for driving in to unload hay is not needed, the length may be diminished 10 feet by substituting a passage 4 feet wide for the 14-foot barn floor, but in that event we would extend the central driveway between the rows of cows the full length of barn, although this would do away with some of the space allotted for calves. We should also prefer to devote some of the space assigned to feed bins to a box stall.

Figure 2 is a cross section of one-half the plan for stable floor, drawn to scale and dimensions given. Please observe that the feeding platform in front of the cows is raised to the level of the top of the V trough. This trough may be made of 2×8 and 2×10 stuff and will be found a great convenience as well for watering cows in cold and stormy weather, as for feeding grain. The present writer advocates doing away with everything in the way of enclosed and separate mangers. There may be, if one deems it indispensable, a triangular partition running out over the trough between the cows, but it is far more important, no matter what style of fastening is adopted, that there should be a partition of some kind, running to the rear and giving each cow an independent stall.

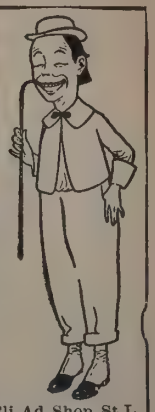
Possibly the most radical item in this plan is the form of the gutter, or trench for receiving the excrement. The bottom is not level as is the usual way, but slopes quite sharply to rear and then turns up at a right angle to meet the central driveway. This arrangement tends to remove the liquid further away and diminishes the opportunities for soiling tails. The inclined bottom of the trench also tends to discourage the habit many cows acquire of standing with hind feet in trench. To obviate too great depth of trench at rear, lay the floor of driveway 2 or 3 inches lower than the platform occupied by cows.

It is not expected that this plan can be followed in all its measurements and arrangements, but it is submitted in the hope that it may be helpful by way of suggestion. Nothing is said about ventilation as that important topic has been fully treated in recent issues. A large flue or shaft for taking out the foul, cold air, may be built anywhere on the outside, preferably with a southern exposure, and several small inlets for fresh air as well as windows for admitting light should not be omitted, whatever else may be curtailed.

And withal do not be frightened at an extra cost of $300 or $400. Make the stable as nearly perfect in all respects as possible, for there is no place on the dairy farm, (unless it be in the purchase of a bull) where liberal expenditure will pay better profits. A well ventilated stable promotes health, saves feed, and increases the quantity and quality of milk.

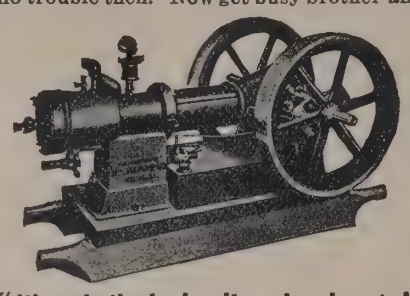
Educating the Hired Man.

ED. HOARD'S DAIRYMAN:—Probably not many hired men, as compared with farm owners, read your valuable paper. And why should they? What does it matter to them whether they know anything much about dairying or not? Brains don't count much in the hired man—not when pay day comes. They say that any fool may be a farmer. That isn't so. But any fool may be a hired man for some farmers, and the bigger gump-head he is, the better, if he only has got the brawn.



There is no place in the world where education and intelligence and experience can be of greater practical value than on the farm. Nowhere are they in less demand.

The highest pay that I can get now, on the farm is $20.00 per month. The highest pay I could get 10 years from now, no matter how hard I worked and how much I knew, would be about $24 or $25—unless perhaps, I got married.



The farmers around here seem to consider a married man worth from 25 to 50% more than a single one. They say that he is more steady. They work the single man half the night and "lock up" at 9 o'clock, so as to keep him steady. How do they expect that he is going to get married unless he sports around some.

I hope sometime to be a good intelligent

FOOL-PROOF

ILLUSTRATION.

THE IMPROVED KEMP SPREADER.

The 1903 round of State and County Fairs, in addition to showing improvements in stock and the products of the soil, will have served to bring a new delegation of farmers into closer touch with some of the more modern pieces of machinery that are so well calculated to serve their interests. The thought is suggested by the announcement that the improved Kemp, the pioneer in the manure spreader field, was to be shown in operation as usual at a leading state fair. Whoever of our readers has had the good fortune to see the Kemp in operation must have been impressed by its work. It is not the first time we have had a good word to say in its favor. But a machine which occupies so important a field in farm economy, and does it so acceptably, cannot be too frequently brought up for public notice. No apology is due, therefore, for again producing the illustration herewith. Its province is keeping up the fertility of the land by making the most of the fertilizers always at hand. It furnishes the one economical way of using the barnyard manures. It brings about their timely distribution before their valuable elements have leached and washed away. The manures are so spread that every particle of fertilizing content shall be absorbed and appropriated by the hungry soil. Some may have had misgivings as to the ability of a spreader to work in any but well rotted and dry manures. If this were true a large part of its value would indeed be lost. But the mind should be disabused of any such thought. This Kemp spreader is equally at home in the refractory, lumpy, strawy, corn stalk manures and in the commercial fertilizers. When loaded, the driver has perfect control of everything from his seat, spreading thick or thin as the soil may require, and only dismounting when he has returned to the yard for reloading. We can make but briefest mention here. It will have served a good purpose if it leads a single farmer, who is yet without a manure spreader, to procure the Kemp catalog and make study of its usefullness in connection with his own land. Address Kemp & Burpee Mfg. Co., Syracuse, N. Y.

farmer and own a large farm, but I can never save the money by working out for $24 per month.

Any fool can be a hired man and, for that matter, any fool may be a lawyer, and here goes one more off in that direction. An ex N. H. HIRED MAN.

NEW YORK MARKET.

NEW YORK, Oct. 10—Butter—Receipts for the week, 43,485 packages.

Exports for the week, 2,203 packages.

Price for fresh creamery butter was marked down one cent per pound early in the week and sales up to Thursday were at 20c for extra goods; later, there was increased demand from all quarters and there was not enough fresh creamery to go around and prices were advanced to 21c. Stocks were well cleaned and prices decidedly in buyer's favor. New York dairy is wanted and full prices are readily paid for fine quality of fresh makes. Exporters are in the market for ladle goods and are reported to have paid 15 to 15½c for about 1,500 tubs. Packing stock sells quick at 13 to 14½c. Market closes in healthful condition and advancing tendencies for all grades. We quote:

Creamery, fresh, extra, 21c; medium, 20@20c½; poor, 16@19c. Creamery, freezer, extra, 20@21c; medium, 17@19c; poor, 14@16c. Dairy, extra, 19@20c; medium, 15@15½c; poor, 13@14c.

Cheese—Receipts for the week, 34,919 boxes.

Exports, 7,579 boxes.

Very quiet market the past week, with abundant stocks of all grade cheese and prices weak.

Some sales of finest small cheese out of cold storage at 12c, and prices for fresh goods were 12@12¼c. Skims unless of finest quality were entirely neglected. We quote:

Full Cream, extra, 12¼c; medium, 11¾@12c; poor, 9@11.

Eggs—Receipts for the week, 43,649 cases.

Our market is unchanged. All new laid stock and best freezer goods are in demand at full prices. We quote:

New York & Penn., new laid, per doz, 27@28c, Northern & Western, new laid, 25@26c; all sections, poor to good, 14@23c. Refrigerator stock, poor to fancy, 18@22c. DAVID W. LEWIS & Co 177 Chambers St.

For Sale—One fine registered 18 months Guernsey bull. Address EDWARD DIETZ, Hyde's P. O., Md. 36-3

HARD FACTS ABOUT CREAM SEPARATORS

The HARD FACTS which concern the intending purchaser of a cream separator—whether for factory or farm use—are briefly these:

That a DE LAVAL Cream Separator is as much superior to imitating machines as such other separators are to gravity setting systems.

That protecting patents make and keep them so—together with far greater experience and superior facilities in every way for cream separator manufacture.

That every big and experienced user of cream separators knows this and uses De Laval machines exclusively—both in factory and farm sizes.

That it is as foolish to-day to buy other than a De Laval separator as it would be to buy an old-fashioned reaper if an up-to-date self-binding harvester could be had for the same money.

The De Laval Separator Co.,

Randolph & Canal Sts., CHICAGO.
1213 Filbert Street, PHILADELPHIA.

Need and Economic Value of Improvement in Dairy Stock.

[Continued from page 776.]

The tendency with too many farmers has been to go from the old barn (with which we were so familiar in days gone by, and through which the wind and snow had free range) to close, unventilated quarters, in which I believe it is impossible to make wholesome milk. Sunlight and good ventilation, however obtained, are essential factors, and so I believe is exercise. I am not in sympathy with the plan, so warmly advocated in some quarters, of leaving cows in the stanchions from fall to spring. It may result in temporary increase of milk yield, but must be at the expense of constitution, if long continued. I would give all cows some out-of-door exercise in all but the stormiest weather. If possible to have a yard or lane so arranged that the cattle could be driven about to the extent of a mile or two every day, I would ask no better arrangement. In the latest barn, built in Newton, are 92 pens, each 7 by 9 feet, in which our cows are kept without tying, this giving opportunity for a good deal of exercise; but, even so, I much prefer that they should be driven out of doors every day, except in stormy weather.

People living in our cities are realizing more and more the need of returning to natural conditions for continued health. It should be no less needful with cattle. Feeding our own cows entirely in the barn, as we do at the home farm, we plan to give them a vacation of two or three months at the Barre farm, when dry or nearly so. If in summer, as is the case with a large proportion of them, this time is spent in pasture, and we believe this tends to improve constitution in both cow and calf.

We believe in liberal, but not high, feeding. Our winter daily ration at the home farm consists of 30 to 40 pounds of ensilage, 8 to 12 pounds of grain, and all the clover, or clover mixed hay, the cows will eat, usually 7 to 10 pounds each. In summer, forage crops takes the place of ensilage to a large extent, though the past year we fed some ensilage every day until green sweet corn was available.

Our grain mixture at present time is 1,150 pounds bran, 850 pounds corn meal, 450 pounds middlings and 400 pounds cotton seed meal; this quantity supplying feed for two days for 143 cows. Ordinarily we do not feed corn meal, but the poor quality of ensilage this year necessitates its use.

We vary this mixture from time to time as the conditions of the grain market and the conditions of our other feed make it seem desirable to do so.

We have experimented with alfalfa to a limited extent, having brought some 30 tons from Kansas and Nebraska, and we find the value to be about one-third more than clover hay. We have made several attempts to raise it, but have not yet succeeded in obtaining and holding a good catch. We do not, however, propose to give it up without further trial, because of its high feeding value, as indicated above, and the fact that it is practically a perennial, having in this respect a great advantage over red clover.

DISCUSSION.

Question: Do you warm the water for your cows?

Mr. Ellis: No, sir, but water is before our cows all the time. If we were watering once or twice a day, I should want to warm the water.

Dr. J. B. Lindsey (Amherst): Will the lecturer add a word to his opinion of how the average cows are kept on the average farm in Massachusetts, and how, in his judgment, they can be improved? That is a subject I believe should be especially dwelt upon. I believe we are behind the times in our methods of producing dairy stock.

Mr. Ellis: I thought the statistics quoted spoke pretty loudly. A difference of 50 per cent between good cows and poor ones should answer that. We are answering the questions of how to improve in our own way by raising our best calves by pure-bred bulls, and these bulls are bought with reference to the purpose. We don't want to use Prof. Sanborn's scrub bulls—I am as much opposed to scrub registered stock as he is, but in our case we want large production as well as rich milk. We therefore breed our pure-bred and grade cows to registered bulls of large milking strains.

Question: How about getting rid of the poor ones?

Mr. Ellis: It takes sand to get rid of them; and yet, watch your figures and you will find you have missed it if you have not used sand.

Prof. F. S. Cooley (of Amherst): How much milk or butter must a cow produce in a year to be profitable?

Mr. Ellis: That depends upon what it costs to keep her. Really, it depends very materially upon two things,—the cost of keeping and the price obtained for milk.

Prof. Cooley: I observe that the lecturer has some idea of what the minimum product of a cow should be, and below which she cannot fall without being sold.

Mr. Ellis: My sand runs out once in a while, and I do not sell a cow when I know I ought to. We ought not to keep a cow that gives less than 5,000 pounds of milk.

Prof. Cooley: That answers the question. Now, what is the difference in value, in your opinion, between a cow that will produce 3,000 pounds of milk and one that will produce 6,000 or 8,000 pounds?

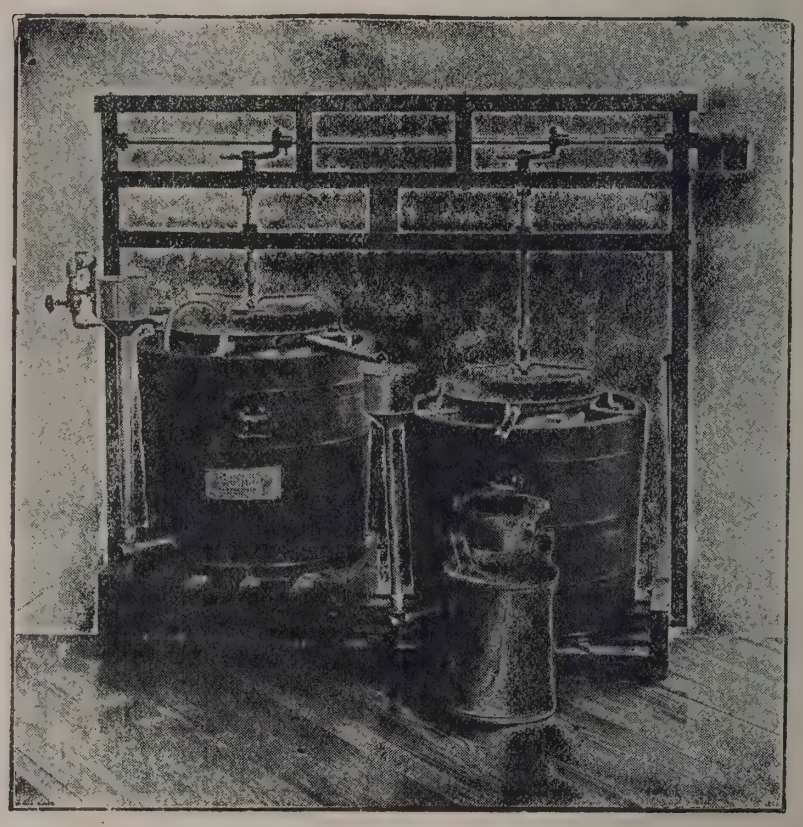
Mr. Ellis: Not allowing for the extra chance for loss—and there is a little extra chance, you are running a greater risk with the better cow—there is no question but what farmers could better pay $100 to $150 for a 6,000 pound cow than buy the average 3,000 pound cow at going prices.

Prof. J. W. Sanborn (of Gilmanton, N. H.): I am at the other extreme from my friend the lecturer. I am out in the country, four miles from any railroad. We make milk for the Boston market at about 2½ cents. I have adopted the practice of selling any cow that won't make 300 pounds of butter fat in a year.

Hon. S. A. Hickox (of Williamstown): I find that it is a very difficult thing to get a herd up to a point of excellence; this year they may do exceedingly well, but may not do so well next year. I can not account for it. We find there are more crooked sticks than straight ones. We believe in good cows, but it is a very difficult thing to get them. We are willing to pay the price for them. I would like to know how to weed out or get and keep a herd up to the point of excellence mentioned—6,000 pounds.

Mr. Ellis: You have got to breed them. We don't discard a cow that does not give us a certain amount of milk at once; we give her an opportunity to come up to the point.

Mr. Hickox: How much grain do you give the first year to the heifers?



Mr. Ellis: That depends. We should give a larger quantity to the heifer giving a large quantity of milk. I will ask my superintendent, Mr. Van Norman, to give his figures. I should say from 6 to 8 pounds, so long as she was in pretty full milk.

Mr. Van Norman: I will say in regard to that, we have no rule. The herdsman is instructed to give that which they need. With a heifer dropping a calf at twenty-four months old, we don't pay much attention to the amount of grain, if she makes use of it for growth or milk. You must bear in mind that a heifer must have food enough to take care of herself, so she may grow and provide milk. Individuals differ, and differ so materially that it is impossible to give a specific amount.

Mr. Ellis: We have almost never had

heife r injured by over feeding.

Question: What do your cows average a day per cow,—how many quarts?

Mr. Ellis: With 6,000 pounds, they would average 7.31 quarts per day. Our basis for figuring is not 2⅛ pounds, which is ordinarily taken. Our records show us every day the barn weights of our milk, and we have also the exact measurement; and our average is just 2½ pounds barn weight to the measured quart, and on that basis it would give 7.31.

Question: Will that average for three years?

Mr. Ellis: It might not for individual cows; it would for the herd.

Mr. R. Harrison (of North Adams): I heard you mention contagious abortion. Are you troubled with it considerably? Can a cow overcome this so you can keep her in your herd?

Mr. Ellis: We have very few cases of a cow aborting the second year. Were I situated like the ordinary farmer, supplying milk to the contractor, so the loss of the product would not inconvenience me, and considering effect on my own herd alone, I would sooner have the foot and mouth disease come into my herd than contagious abortion. It would cost me less money in the long run. I do not want to belittle the foot and mouth disease, but I do want to emphasize the difficulty with contagious abortion. I had it 7 or 8 years ago, and it is most serious.

Mr. Harrison: You have abortion occasionally. What do you lay it to, generally speaking,—to the cow being roughly handled, or what?

Mr. Ellis: If only occasional, it is generally the result of accident.

Mr. Harrison: How is it with younger cows and older ones, as compared to the number of cases?

Mr. Ellis: It is about the same proportion.

Mr. Harrison: What has been your experience with reference to abortion? I want to know in regard to a cow carrying her calf after she has aborted once,—does she twice? My experience is, that when I have had one abort even several times, after she drops a live calf then there is no more abortion. After they drop a live calf, I had rather have them than one that never aborted.

Mr. Ellis: We have very few cases of abortion the second time.

Mr. Harrison: Hasn't it been proved it is a disease, and not a mechanical trouble?

Mr. Ellis: Yes, but we use the greatest care in disinfecting both our bulls and cows.

Mr. Harrison: I would like to know what you use for antiseptics, and how soon you allow service after abortion.

Mr. Ellis: The time would vary,—never less than three months, and from that up to six months, depending upon the condition of the cow. Carbolic acid is as good as anything. It makes very little difference which of several antiseptics you use, as long as they are properly used.

With reference to pasturing, I will give the experience we had last year in one pasture. We leased a pasture of about 132 acres; in one corner was quite a lot of marshy land, so there was very little over 100 acres left to pasture. We put into the pasture 65 heifers and a bull, and it not only carried all those animals, but we found the grass was getting ahead of us. We mowed two tons of good hay in July, and put 30 dry cows there about six weeks in one part of the pasture, and those taken out the day before Thanksgiving, were fat.

Dr. J. B. Lindsey: I believe this is a subject of very great interest to the farmers of Massachusetts. I have felt for a long time, and still feel, that we as dairymen did not give sufficient attention to the improvement of our dairy stock. It has been a great pleasure to me to visit occasionally Mr. Ellis' herds, and see what a wonderful improvement he has made and the great success he has had in developing his herds. He has 200, more or less, of as fine heifers—the finest, I might say- that I have ever seen, and he has done that by applying common sense in their development. I wish every one of you could see that herd of young stock. I don't mean to say we all could have just the breed he has—that breed is suited to his particular condition; but I do believe that we can make a herd develop suited to our conditions, and I think the hit-or-miss plan which so many farmers in Massachusetts are following at the present time is a great mistake. I think we should take pride enough to endeavor to build up our herds and improve them. I do hope that the members of this Board will take sufficient interest to go home and preach improvement in dairy herds among the people with whom they come in contact.

Mr. Van Norman: I would like to supplement somewhat that which Mr. Ellis has said, and to answer a little more fully Prof. Cooley's question as to how the farmers of Massachusetts can improve their herds.

What Mr. Ellis has said is based upon accurate records, kept as he wants them kept, and in such a way as to give him the knowledge on which to conduct his business. If there is any one thing that I am sure he would wish to emphasize in reference to this, it is that you should have accurate knowledge of each individual cow, know what she is doing, and have the sand to cut out those who are not doing the business.

I would say, then, the first thing in improving your herd is to know your herd, and know what each one is doing. And I would say that we have no rules, only maxims, We endeavor to see that there shall be an intelligent observation of every individual, and that that individual shall be treated as her conditions require. For that reason I did not wish to answer the question definitely as to how much feed we give our heifers. It does not make much difference, as Mr. Ellis says, if they get there in their work. We try to develop a heifer so that she will give a maximum amount of milk, 6,000 or 7,000 pounds, by careful observation of her condition and constitution, giving her grain up to the limit where the result is best, but we won't exceed 12 pounds per cow per day. What difference does it make what you feed that heifer, if you develop an 8,000-pounds cow? I would emphasize that side of this subject—that you know your cows, know them individually, how much they can make use of, and know what that will do.

Question: What grain do you feed?

Mr. Ellis: As I said before, our mixture at present is 1,150 pounds of bran, 450 pounds of middlings, 850 pounds of corn meal and 400 pounds of cotton seed meal. We vary that somewhat, as the cost of feed varies. This year we are feeding corn meal where ordinarily we should not, because of poor quality of ensilage.

Question: Do you feed gluten meal?—it is cheap enough.

Mr. Ellis: We do at times.

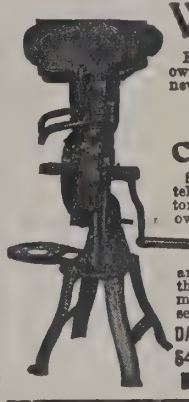
The distracting headaches from which so many women suffer make life a daily purgatory. If men suffered with headache as women do, business would be almost at a stanstill. Does not the fact that men do not suffer from these severe headaches suggest that there must be a womanly cause for them?

When the womanly organism is diseased, headache, backache, nervousness and sleeplessness are consequences which are sure to follow.

Dr. Pierce's Favorite Prescription cures headaches and other aches and pains by curing their cause. It establishes regularity, dries unhealthy drains, heals inflammation and ulceration, and cures female weakness. It soothes pain and builds up the nerves. It transforms weak, sickly, nervous invalids into happy, healthy women. Thousands have testified to its marvelous merits.

"I took two bottles of your 'Favorite Prescription' and two of the 'Golden Medical Discovery' and am feeling well," writes Mrs. Dan McKenzie, of Lorway Mines, Cape Breton Co., Nova Scotia. "I had uterine trouble, pain in the side and headache. After taking your medicines I got well. You may publish this or use it in any way you think best, as I cannot speak too highly of Dr. Pierce and his medicines."

"Favorite Prescription" has the testimony of thousands of women to its complete cure of womanly diseases. Do not accept an unknown and unproved substitute in its place.



FREE. Dr. Pierce's Common Sense Medical Adviser is sent *free* on receipt of stamps to pay expense of mailing *only*. Send twenty-one one-cent stamps for the the book in paper covers, or thirty-one stamps for the cloth-bound volume. Address Dr. R. V. Pierce, Buffalo, N. Y.

Reid's
Hand
SEPARATOR

The "best" separator is that one which does its work most thoroughly and easily, that is built of strongest material, and that is most easily washed and kept in order.

First cost is a great point with a buyer, but ease of running, perfection of skimming and simplicity in washing are even greater considerations.

The **Reid Hand Separator** has but a single cylinder inside the bowl, and skims as closely as one-hundredth of one per cent. Indeed, some tests indicate "not a trace" of fat in the skim milk.

The Reid is perfectly planned and strongly built, and it literally "runs like a watch."

As to our guarantee of excellence, we make the strongest statement that can be expressed in words: **Money back (less freight) if the buyer is not satisfied.**

There is a new (free) booklet about the Reid Hand Separator.

Sizes run from 150 lbs. to 500 lbs. per hour.

Some Jersey Tests.

ED. HOARD'S DAIRYMAN:—We don't see in the DAIRYMAN as many reports from pure-bred Jersey dairy herds as I should like. Here are the complete results of the last season of the little bunch at Lake Grove farm. As my dairy inspiration and ambition for "something better" came in the first instance from the DAIRYMAN you may properly claim a share in the showing made:

Allie of Lake Grove 166827 (test 15 lbs. 2 oz.), in 46 weeks milked 7,390 lbs. 2 oz., with monthly composite fat tests indicating 441 lbs. 4¾ oz. of butter, estimated 85% fat. During the five weeks ending in April, 1902, she made 71.985 lbs. of butter as indicated by the Babcock; an average of over 14 lbs. per week for the five weeks.

Clara of LakeHome 161641, in 51 weeks, her first season, milked 5,975 lbs. with her monthly fat tests indicating 377 lbs. 4 oz. of butter.

Duchess of Pleasant View 144633, credited with a churn test of 13 lbs. 11 oz., with her first calf, at 21 months old, milked 6,365 lbs. 4 oz. in 48 weeks, with her monthly fat tests indicating 402 lbs. 11½ oz. of butter.

Ethel Signal Rex 143875 in 52 full weeks, her second season, milked 7001 lbs., 1 oz., with her monthly fat tests indicating 465 lbs., 9 oz. of butter.

Siglolias 151127, test 14 lbs., 7 ozs. with second calf (after milking over 6,000 lbs. in 354 days her first season), milked 5,303 lbs., 15 ozs., in 39 weeks, her second season, with the monthly fat tests indicating 337 lbs., 13½ ozs. of butter. Olga Victor Pogis 12711 (test 17 lbs., 6 ozs.) milked 7,930 lbs. in 46 weeks, with her fat tests indicating 483 lbs., 2 ozs. of butter. In the first 5 weeks after freshening, she made 79 lbs., 8 ozs. of butter, over 15½ lbs. per week. We have since lost this cow with milk fever.

Sweet Briar Signal Torment 168799 in 52 weeks, her first season, milked 5371 lbs., 3 ozs., with the monthly fat tests indicating 347 lbs. 7 ozs. of butter.

Princess of Lake Grove (test 14. lbs. 4 ozs.) in 52 weeks milked 6861 lbs. 15 ozs. with monthly fat tests indicating 476 lbs. 6 ozs. of butter.

Amy of Prospect 138767 in just 352 days, her second season, milked 5004 lbs. 12 ozs, with fat tests indicating 361 lbs. ½oz. of butter. This is the highest testing cow in fat per cent that we own.

Pedro's Sallie Signal 169391 freshened at 17 months old (being bred by accident) and within a year, her first season, milked 3546 lbs. 11 ozs. with her monthly fat tests indicating 216 lbs. 12 ozs. of butter. This young cow and Siglolias, Ethel Signal Rex, Sweet Briar Signal Torment, and Clara of Lake Home are closely related in blood, as are also Allie of Lake Grove and Princess of Lake Grove. The members of the milch herd not mentioned number eight cows and heifers that have not yet completed a season with us.

Our grain ration runs from 6 lbs. to 12 lbs. per day, chiefly bran. In the summer season the cows are on pasture, with grain and green feed of some sort at the barn night and morning. For the past two winters we have fed silage with great satisfaction to both the cows and ourselves.

Our fat tests are made from a composite sample of from 6 to 14 consecutive milkings of each cow, the samples being taken generally about the middle of the month. Since July we have sampled only six milkings for the test sample. Having ascertained the fat per cent, we use that as the basis for estimating the butter (85%) for the weeks ending in the month. As our milk records are kept by weeks (each milking of every cow being weighed and recorded), it is a little handier for us to estimate our months as 4 or 5 weeks as the case may be, instead of the exact calendar month.

Lake Co., Ohio. E. E. STEVENS.

A Question of Law.

Liability for Bull.

J. C. L., Dodge county, Wis.: I am a breeder of pure bred Short-horn cattle. I have a neighbor who keeps scrub cattle of the worst kind. His pasture joins mine and I am continually having trouble about a scrub bull that he allows to run in his pasture. I own all of the fence between our pastures and I have a good, new six wire fence. But nothing can turn his scrub, and it has got through my

DAIRY FARM
FOR SALE
Equipped with every modern facility and convenience with 80 head high class Jersey milkers paying 15 to 20 per cent on investment. Located at Pass Christian, Miss., the mecca of northern health seekers. The average price of dairy products there surpass anything in the north. No such combination of inducements have ever before been offered anywhere. Owner reluctantly consents to sell, his time being monopolized in other lines. Right party buying all personal property can secure favorable lease of premises.
S. Q. HOLLINGSWORTH, COUSHATTA, LA.

FINE DAIRY FARM
FOR SALE—134 acres of good land three miles from Erie R. R. and Buffalo & Susquehanna R. R. Four barns; one large dairy barn 56x36 feet, steel track and horse fork in same, all complete. Large house with cellar under same. Well watered and fenced—in fact it is the finest dairy farm in state of New York. Will sell with or without stock and other personal property. Will trade for Hardware Stock in a good business town.
J. L. HAYNES, Addison, N. Y.
Steuben County.

"IT'S UP TO YOU!"

fence several times and has got two of my best heifers in calf. I can prove that the scrub served them. Has my neighbor any right to let his bull run, and, if he has, have I any remedy? He claims that the bull got through my fence and that he is not liable,

Answer: You can probably recover damages from your neighbor if he is worth anything and the facts are as you state them. You do not describe your fence accurately, so we are not certain that it is a sufficient legal fence. Section 1390 of the statutes of 1898 describes a legal wire fence as follows: "All fences consisting of five barbed wires with at least thirty-six barbs each to the rod, firmly fastened to posts well set, not more than sixteen feet apart, with one good stay between the posts, the top wire not less than forty-eight inches high at the place of attachment, the bottom wire being not more than seven inches from the ground, the space between the the bottom and the second wires being not more than seven inches, between the second and third wires not more than eight inches, between the third and fourth wires not more than twelve inches, and between the fourth and top wire not more than sixteen inches, measurements to be made at the place of attachment." It further provides that "all fences consisting of rails, timbers, wires, boards, or stone walls, or any combination thereof * * * or other things which shall be considered equivalent to either of the fences herein mentioned in the judgment of the fence viewers within whose jurisdiction the same may be, shall be deemed legal and sufficient fences." You say that your fence is new and has six wires. If it is well made it will probably satisfy the requirements of the statutes for a legal fence. Section 1391 of the statutes requires the occupant of adjoining lands used for farming purposes to keep and maintain legal partition fences such as are enumerated in section 1390 and further provides that owners who do not "keep in repair lawful partition fences" shall not be entitled to recover damages for trespassing animals. If your fence does not conform to the statutory requirements, evidence to that effect would prevent you from recovering damages in the case of trespass by ordinary farm animals. The legislature of 1903 amended section 1482 in regard to male domestic animals running at large, so that it now reads as follows:

"No stallion over 1 year old, no bull over 6 months old, nor boar nor ram, nor billy-goat over 4 months old shall run at large, and if the owner or keeper shall, for any reason, suffer any such animal so to do, he shall forfeit $5 to the person taking it up, and be liable in addition for all damage done by such animal while so at large, although he escapes without the fault of such owner or keeper; and the construction of any fence enumerated in Section 1390 shall not relieve such owner or keeper from liability for any damage committed by an animal of the enumerated class upon the enclosed premises of an adjoining owner." The intention of the legislature would seem to be, in adding the last clause, to except male domestic animals from the operation of Section 1391 and place upon the owner or keeper the absolute responsibility of taking care of them. Swine had been so excepted by chapter 278 of the law of 1889, but the chapter has been embodied in an ambiguous manner in the last clause of Section 1390 of the statutes. The Supreme court has not yet put any interpretation on these two provisions, however, and it is best to base your claim to damages on sufficiency of your fence. Your neighbor has a perfect right to allow his bull to run in his own pasture, but if it escapes into your pasture and does damage you can collect, provided you are maintaining a lawful partition fence. The measure of damages in such cases is a difficult one. It should be the difference in value between the heifers in their present condition and their value if the unfortunate circumstances had not happened.—*Sentinal Farmer.*

Holstein-Friesian Breeders Third Semi-Annual Consignment Auction Sale
414 South Clinton Street, Syracuse, N. Y.,

WEDNESDAY, OCT. 28th., 1903

I am instructed by the following well known breeders to catalogue and sell on the above date one of the most selected and choice lots of Holstein-Friesian Cattle ever yet offered to the public, consisting of cows and heifers with A. R. O. butter records ranging up to and over 21 lbs. each. Young bulls, cows and heifers whose dams have A. R. O. butter tests ranging up to 25 lbs. These choice females and several others bred to such noted bulls as Mercedes Julip's Pietertje Paul, Beryl Wayne's Paul De Kol, De Kol 2nd's Butter Boy 3rd., Mutual Friend 3rd's Paul, Johanna Rue 3rd's Lad and Sir Korndyke Manor De Kol. The contributors are A. A. Cortelyou, Neshanic, N. J.; F. P. Knowles, Worcester, Mass.; T. A. Mitchell, Weedsport, N. Y.; H. L. Bronson, Cortland, N. Y.; Stevens Bros., Lacona, N. Y.; H. A. Moyer, Syracuse, N. Y. Communications and applications for catalogues, which are now ready, can be addressed to either of the contributors, or

W. C. HUNT, Sales Manager, Liverpool, N. Y.

The above breeders will hold their next Auction Sale on the New York State Fair Grounds, Syracuse, June 2 and 3, 1904, the two days following the next annual meeting of the Holstein-Friesian Association. This will be made a regular annual event.

FOR SALE 2 H. F. Bull Calves, 6 mo. old, sired by Johanna Aaggie's Paul De Kol 23443, (160 A. R.) from good milkers and testers.
M. S. CAMPBELL, Genoa, DeKalb Co., Ill.

Smiths & Powell, Syracuse, N. Y.

A Unique City Milk Plant.

Sanitary, Convenient and Fireproof.

ED. HOARD'S DAIRYMAN:—I have seen many milk plants, many larger and more pretentious in appearance, but never one as truly sanitary, thereby meaning convenient to keep clean and actually kept clean. This plant would be the joy for some of our scientific and sanitary milk cranks to look at, and I hardly know where one may be found that so fully comes up to the truly sanitary standard. This is especially worthy of our attention in these days of pretenstions and shams, especially as regards many so-called sanitary milk plants, where both pasteurizing, cooling and general handling of the milk and cream is frequently carried out in anything but a "sanitary" manner. While Mansfield, Ohio, is only a small city of about 20,000 people, still it is a place which appreciates a good thing, more so than some much larger places. Until about half a year ago, all milk was supplied by a number of small dairymen and peddlers; then a number of these combined and started a "Pure Milk Co.," so-called. Unfortunately, as is generally the case when a number of farmers unite, the necessary business management is lacking, and things don't turn out as had been hoped for.

Thus, since the establishment of the Loiselle Bread and Milk Co. which began supplying milk Sept. 1st, we have two milk companies in this town—one too many, which time will show. The Loiselle Bread and Milk Co. has another original feature, as the name indicates: Baking and milk business run together, and thus far the indications are that this experiment will be successful. Four wagons were already delivering bread and cakes all over town, and now milk and cream is being distributed by the same wagons, one man and two or three boys delivering milk and bread to the houses from each wagon. Two more milk delivery wagons have been added, and these also carry bread. It is too early to judge whether this delivery system will be successful; but the fact that Mr. Loiselle, who is general manager, gives his personal attention to all details and has been most successful in establishing the best and largest baking and ice-cream business in Mansfield, makes my faith strong in a decided success of the milk business also.

The motto is: "Slow but sure." No advertising has as yet been done, and though many people don't even know yet that this milk business is in operation, still the trade is growing daily. The writer is engaged to supervise the proper start, and before operations were begun the dairies of all farmers who were to furnish milk were visited by him, and the proper care and cooling of the milk before delivery was discussed. The result has been that of all milk delivered from twelve patrons up to date, we have had to return only one can, all other milk being received in perfect condition for proper pasteurization.

This is so much more noteworthy, as very few of our patrons had any ice and had to depend on spring, well or cistern water for cooling their evening's milk. During a hot spell we received some night's milk here at a temperature of 65°, altogether too warm, and yet samples of such milk left standing in a warm room would keep perfectly sweet for six hours and longer. In no case would the milk show 0.2% of acidity, which I think goes to prove that the mi[illegible] carefully and cleanly [illegible] milk pails, strainers [illegible] tary conditions [illegible] ery fact [illegible] have a [illegible] and [illegible] ll as [illegible] her- [illegible] ile [illegible] ill [illegible] t

ter is produced; the price 12 cents per gallon, or 4 cents per quart, bottled. Skimmed milk is 10 cents per gallon. No milk, cream or ice-cream is sold except what has been pasteurized and a large portion of skimmed milk is used for the bakery. The ice-cream business is considerable, and two qualities are sold; the best $1.50 per gallon, and a cheaper grade at $1 00.

No new enterprise has ever been established, where it was not found that *some* things might have been arranged still better; but in most new milk enterprises, some serious blunders have been committed, which it took a long time to overcome, and the effects of which have even ruined the whole undertaking. Especially where pasteurization is yet an unknown process, which carries with it the idea that milk of all kinds of doubtful qualities from a lot of dirty farmers, is simply mixed and goes through a kind of boiling process, a natural prejudice has to be overcome, and this can only be done by exerting the utmost care in all departments of the work, from the handling and delivery of milk by the farmers till the distribution into the houses of the consumers. An absolutely faultless and uniform article of milk must be supplied to the consumers from the first day and every day thereafter. Anyone in the milk business knows what mischief is wrought by one day giving your customers an inferior or faulty article, and this still more holds good when pasteurized products are supplied, and properly so, because the consumers have been told before hand that pasteurized milk and cream is superior to any other, and always is perfect and of extraordinary keeping quality. If this claim is not from the start proved as true, the consumers have a right to complain, and will not forget to do so.

To say that the company has delivered milk to about 400 customers for a month and had no complaints would be untrue, but we have had no more than to enable me to call on all such parties and find out what was the matter. A few claimed that their milk was sour next morning; but I found a bottle partly full of milk, unclosed, on an open shelf at 4 p. m. in a room of about 80°. The only argu-

THE VALUE OF CHARCOAL

Few People Know How Useful it is in Preserving Health and Beauty.

Nearly everybody knows that charcoal is the safest and most efficient disinfectant and purifier in nature, but few realize its value when taken into the human system for the same cleansing purpose.

Charcoal is a remedy that the more you take of it the better; it is not a drug at all, but simply absorbs the gases and impurities always present in the stomach and intestines and carries them out of the system.

Charcoal sweetens the breath after smoking, drinking or after eating onions and other odorous vegetables.

Charcoal effectually clears and improves the complexion, it whitens the teeth and further acts as a natural and eminently safe cathartic.

It absorbs the injurious gases which collect in the stomach and bowels; it disinfects the mouth and throat from the poison of catarrh.

All druggists sell charcoal in one form or another, but probably the best charcoal and the most for the money is in Stuart's Absorbent Lozenges; they are composed of the finest powdered Willow charcoal, and other harmless anti-septics in tablet form or rather in the form of large, pleasant tasting lozenges, the charcoal being mixed with honey.

The daily use of these lozenges will soon tell in a much improved condition of the general health, better complexion, sweeter breath and purer blood, and the beauty of it is, that no possible harm can result from their continued use, but on the contrary, great benefit.

A Buffalo physician in speaking of the [illegible]enefits of charcoal, says: "I advise [illegible]tuart's Absorbent Lozenges to all pat-[illegible]ts suffering from gas in stomach and [illegible]els, and to clear the complexion and [illegible]y the breath, mouth and throat; I [illegible]elieve the liver is greatly benefitted daily use of them; they cost but five cents a box at drug stores, [illegible]ough in some sense a patent pre- yet I believe I get more and [illegible]arcoal in Stuart's Absorbent [illegible]han in any of the ordinary [illegible]lets."

A Bad Fix

When one wakes up aching from head to foot, and with the flesh tender to the touch, when

Soreness and Stiffness

makes every motion of the body painful, the surest and quickest way out of the trouble is to use

St. Jacobs Oil

promptly. It warms, relaxes, cures. Price, 25c. and 50c.

TERRIFF'S PERFECT WASHER

is for the cow's case. It conditions, prepares for calving difficulties, cures barrenness, milk fever, garget, all breeding difficulties. 100,000 cow owners call it the one true specific cow remedy. Dealers sell it. Kow-Kure book **mailed free**

Dairy Association Co., Lyndonville, Vt.

FOR THE PROFIT THERE IS IN IT

You must make your butter the best possible if you would command the highest price.

Colonial Butter Salt

AND

Liberty Butter Salt

"MONEY MAKERS FOR BUTTER MAKERS"

Are freely credited, by the creameries who use them, with improving the quality of the butter over any other salt, being perfect in flavor, color, and purity, lighter and drier than any other, dissolving more quickly, preventing danger of streaked or mottled butter, while it is safe to work the butter less with these salts than with other makes. Regarding our two brands,

COLONIAL Butter Salt is a light, flaky grain, the lightest for the same bulk that there is on the market. While other makes use a barrel with but a 30 inch stave and a 19 or 20 inch head to hold 320 lbs., Colonial requires a barrel with a 34 inch stave and a 21 inch head to hold the same weight.

LIBERTY Butter Salt is granulated, every grain of the same size and perfectly square; contains one-tenth of one per cent. moisture, so it, as well as the Colonial brand, has the "make weight" feature. It is a little coarser in grain than any other granulated salt, which is a decided improvement, and because of its uniform grain it dissolves evenly and does not leave the butter gritty or mottled.

Send for Free Sack

of either or both these brands. Your request on a postal card will assure the prompt delivery to creameries and cheese factories only, without cost, a 56 lb. sack of either or both. Let us know your success with it after trial.

COLONIAL SALT COMPANY, AKRON, OHIO.

CHICAGO OFFICE—84 ADAMS STREET

ment the woman made was: "But it did not sour yesterday." The fact is, that bottles of milk, which had been out on a delivery wagon for hours, and were then placed in a warm room, would always keep sweet 24 hours, generally longer.

This is all that reasonably may be expected. Some will complain that the cream, which tested 24 per cent fat, was not rich enough. It has found that many have been accustomed to cream from private dairies which has been doctored so well with the so-called "cream thickener," which article is widely advertised. It takes some time before the customers learn of these mysterious tricks, which make a very inferior cream, half milk, appear as if it were very rich. What an enormous amount of stuff people consume which has been fixed up by "cream thickener," "viscogen," coloring matter and preservatives. If Profs. Babcock and Russell had imagined what fraudulent use would be made of it, they would not have given their invention of "viscogen" to the world, and we would have been better off without it. The Company has thus far succeeded only in putting an absolutely perfect milk on the market; all milk has been uniform, never the slightest cooked, or strange flavor being perceptible, and the cream line every day being perfect and alike in all bottles This was of even greater importance here than in most places the prejudice against pasteurized milk having been increased because (I am sorry to say) much improperly pasteurized milk had been put upon the market by the other milk company here. Many people would not buy our milk simply because they had tried the other. They are gradually getting over that notion now, and the demand for our milk and cream is rapidly increasing. "Be sure you are right and then go ahead," but not before. That is a safe motto, and not least in the pasteurizing milk business.

The building is the first of its kind in this country; it is entirely of concrete, the only inflammable material being the doors and window frames and no insurance is carried. The bakery and ice cream business and the milk plant will all be under one roof, but the bakery is not yet finished, all baking being still done in an adjoining building. The plant is built on a slope, all milk being received at the upper side and put on the delivery wagons below. Thus, neither milk pumps nor elevators are used, a decided advantage. The man who weighs the milk, may from above overlook both separator, pasteurizer and bottler, all being placed on a straight line. As soon as we have secured cuts, we shall be pleased to have HOARD'S DAIRYMAN use them for the benefit of its readers.

If any of my readers are contemplating going into the sanitary milk supply for some city, and intend to pasteurize (no other system will be found practical today) I would advise such if possible, to visit this Mansfield plant; no matter which others and much larger ones they may visit, they will see and learn some things here, which they cannot in any other place. They will also find Mr. Loiselle a gentleman, who not only has the reputation of a most successful business man, but who always is glad to impart information to others.

I have said nothing as to what make of separators, pasteurizers, milk bottlers and other implements are used here. Call and see for yourselves.

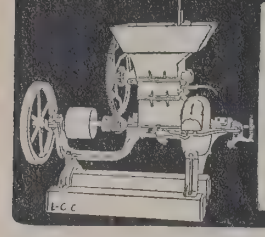
HAVANA METAL WHEEL CO.

HAVANA, ILL.

Grind 46 Bus. Baskets Ear Corn Per Hour

with this Improved Wolverine Ball Bearing, Triple Geared Grinding Mill. **CRUSHES AND GRINDS** ear corn in any condition; shelled corn, rye, oats, barley, Kaffir corn, etc., singly or mixed. Makes coarse, medium or fine feed as desired. Never "chunks" or "hogs" the feed, but produces an even and uniform product. **It is the only sweep mill guaranteed to equal the work of a buhr stone mill.**



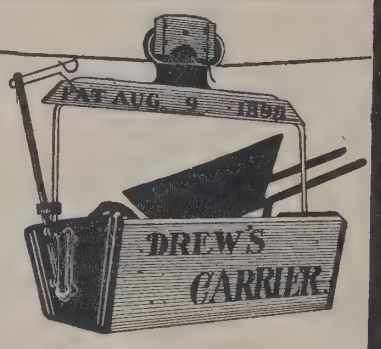
IT IS STRONG and is made of the best material money can buy. The castings in the gears are specially heavy and will stand the most severe strain that can be legitimately required of a grinding mill. **The quality is shown by the weight which is 600 pounds.** If it were lighter it would be cheaper, but not so good. **CAPACITY.** This is a stumbling block in the way of grinding mills. We have tested this one under all conditions with all kinds and quality of grains. **Our statement is a guarantee:** If the corn is dry, and the team makes five rounds per minute **this mill will crush and grind 46 bus. baskets of ear corn per hour.** If the team makes three rounds per minute it will grind 28 bus. baskets per hour. Grinding finer, the capacity is less. **LIGHT DRAFT.** Notwithstanding the enormous capacity of this mill it is the lightest draft sweep mill known. **This is so because it is fitted with specially made hardened steel Ball Bearings.** These ball bearings will last a lifetime with ordinary care. We replace any that are found defective or wear out within five years.

$23.25 OUR OFFER. **We know that this mill is so good, and so entirely reliable that we will ship it to anyone in the United States with the understanding that if the mill does not do just as we claim, and does not grind more than any two-horse mill made by any other manufacturer of any construction, of any size buhrs; if the mill is not made on more scientific principles; if it does not grind a more uniform quality of feed and if it is not better in every way than any other sweep mill, it may be returned to us at our expense within three days of the time you receive it. Test it in comparison with any other mill and keep the one which is best.** **LARGE LINE.** We have eight sizes of sweep mills, $13.75 and up, and thirty other styles and sizes of grinders suited to all grains and purposes.

CUT THIS AD OUT and send it to us and we will mail you our special farm machinery catalogue. Don't buy a grinding mill of any kind until you get it. It is sure to save you money.

MARVIN SMITH CO. 55. 57. 59. N. JEFFERSON STREET. CHICAGO. ILL.

EASY GRINDING



Corn in the ear and all grains, any sort of chop mixture. For speedy and perfect work, saving feed and labor, the all-purpose grinding mill is the

Made in a variety of styles, including **Power Mills, Sweep Mills, Mill and Power Combined.** The line that meets feeders' wants and is right in price. Don't buy until you have seen our late catalogue. Mailed free. Write for it to-day.

THE FOOS MFG. CO., Springfield, Ohio.

GOODBYE, WHEELBARROW

Every farmer who gets a Drew Elevated Carrier has no more use for the barnyard wheelbarrow. The

DREW ELEVATED CARRIER

will carry the manure from the stables to any point in the barnyard, drop it, return automatically, ready for another load.

It is self operating—it turns curves and switches—dumps its load in yard or wagon. Besides carrying manure you can use it to convey ensilage, feed, grain, potatoes, cans of milk, from one point to another. It works so simple and easy that any man or boy can run it.

THE DREW ELEVATED CARRIER

carries labor off from the farm—it is the farmer's labor and money saver. No trouble to put them up—no trouble after they are up.

It leaves barnyard free from posts—keeps the barnyard clean and free from litter. Get one and

"WATCH IT WORK FOR YOU"

A RARE CHANCE
FOR A GOOD DAIRY FARMER

A farm of 465 acres will be sold cheap and on easy terms to right party. Farm is located at Waucota, Goodhue county, Minn., on river division of the Milwaukee road. East line of farm Lake Pepin. West line the railroad. Station within a hundred yards of buildings. Waucota is less than 50 miles from St. Paul and Minneapolis. Farm has 300 acres under plow, 100 acres pasture, balance timber. Barns for 40 cows, horse barn, granary, buildings for small stock, etc. House, 8 rooms. A rare chance for either a butter maker or one desiring to ship milk to the Twin Cities. For further particulars address

J. NEWTON NIND, Kimball Building, Chicago, Ill.

Buff Jersey Notes.

ED. HOARD'S DAIRYMAN:—I have in my desk several book orders that I cannot fill owing to the name of the sender or name of town and state not being given. Will those who have not received the book kindly send their full address, so I can fill their orders.

Yesterday we finished putting up our ensilage, all sorghum, and it will make a nice lot of feed for the Jerseys this winter; as to the yield it is fully one-third greater than the corn crop, and as for the feeding value is ton for ton equal to corn. The Tennessee Experiment Station, in a series of tests with beef cattle, got better results with sorghum silage than with corn silage. I said our ensilage was all sorghum. I should have said rape and sorghum. Last spring we sowed 16 acres of rape for hogs and young stock pasture, and then found we did not need it, so disced the land to kill the rape and planted sorghum. The rape was not all killed, and grew quite thick and large in the rows of sorghum. It all went into the silo, so the cows will have a variety of flavors.

Last year, I thought the interest in silos and ensilage had reached the high mark, as my correspondence and institute work was mostly along the lines of this subject, but I was mistaken, for this year the stockmen have taken the matter up, and there is no doubt that there have been more silos put up by cattle feeders this year than any other year; and in the case of Iowa, Nebraska and Missouri there have been more built than in all previous years combined, and by the way I have been sending out books and instructions; most of those built were Buff Jersey silos.

I was amused this fall in visiting a silo on a dairy farm to see one of the men employed on the farm putting putty in the cracks of a factory made silo; this silo is of red wood and tongued and grooved, but has never kept the contents as it should, but through no fault of the silo. The putty was being forced in the cracks of the dry wall, and would be forced out again as soon as the staves began to swell after the ensilage was put in. This illustrates how little some people know of the subject of silos. The strongest point in the favor of my silo plan is the cracks in the walls during the time the silo stands empty, these cracks cause the 2×4s to quickly dry out, and checks any tendency to decay, as a dry wall cannot rot.

Last week we attended our State fair, and as usual made entries of butter. Our one-pound prints scored 96 points, and the packed ten-pound tub 95, we now have made 15 entries in the past five years, and have to show for it ten first, one second, and one third premium, a record we feel quite proud of, considering we keep only Jerseys.

I met a large number of dairymen at the fair, and about the first question they would ask me was what are you doing for hired help? My answer was that I would close out my dairy interests in the spring just for the very reason that I could not get the necessary help to handle the class of cattle that I have. But they would say you have a large family to help you; true, but I have given them an education that has made a demand for them as managers of large stock farms at salaries that my business will not justify me in paying, leaving me just where I stood some years ago, when my boys were too young to assist me. The only thing left me is to take a position where only myself will be considered, or perhaps it would be possible to operate a stock farm with the help one might secure. I would like to fit up a stock farm on the ensilage feeding plan as an object lesson to the doubting Thomases that ensilage is the best and cheapest feed that is available in the great corn belt, and I invite correspondence from men who have large stock farms, with this object in view.

Next week the Farmers' Institute season opens with me, my first meeting being in one of the counties that is in my Congressional district, of which I am director. The matter of greatest interest this year in our state is the corn contest boys. These boys received 500 grains of pedigree corn last spring from the secretary of the State Institute organization, and will make exhibits of the corn raised from it at the different institutes in the counties of the state. They will be awarded premiums, and the best samples will be saved for the World's Fair,

From "ODD JOBS" to a COMPETENCY

WILLIAM C. RICHARDS was doing "odd jobs" in his town in southern Michigan when he answered an advertisement for agents to represent THE LADIES' HOME JOURNAL and THE SATURDAY EVENING POST. The first month he earned $64.00 in commissions and prize money and dropped the odd jobs.

Through this work he heard of an important position with a Western railroad from several officers of which he had secured subscriptions. They had been pleased with Richards' tact and energy, and he secured the position. He writes: "The subscription work paid me much better than any previous employment and gave me an invaluable knowledge of men and methods. I can recommend it to any ambitious young fellow who is cramped up in a small town."

We are giving

$50,000
In Extra Cash Prizes

this winter to the 3000 agents who do the best work for us—a part each month. Besides this, every subscription secured is liberally paid for. No expense involved. Write for details.

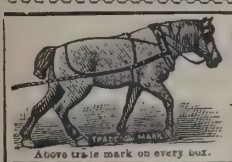
"ADVERTISEMENT"

COLIC

PAIN in the intestines or stomach of a horse is called colic. It frequently occurs from constipation or by the bowel becoming occluded or impacted with fecal matter.

It may also result from indigestible foods, from improperly cured grains, sudden changes of diet or any influence which will reduce the digestive powers of the animal, such as exhaustion, exposure to severe cold. If animals are fed while in this condition they are extremely apt to suffer from cholic.



Colic due to fermentation of the food or flatulence is best treated by giving remedies which will prevent formation of gas and absorb that already formed. For this purpose alkalies give best results, such as 1 to 2 ounce doses of aromatic spirits of ammonia well diluted. In severe cases anodyne should also be employed. For this purpose 2 ounces of fluid extract of hyoscyamus, or ounce doses of chloral hydrate diluted, can be administered at once.

In cases of cholic due to impaction stimulants must be administered. Recent treatment by the administration of half ounce to an ounce of powdered nux vomica with 2 ounces of carbonate of ammonia made into pills and given at once, has given excellent results. This can be followed by such laxatives as a pint of flaxseed oil or a half-pound of glauber salts. Aloes as a purgative is not always free from danger, as in many cases it proves to be poisonous.

Keeping the horse in thorough condition is the best preventive of cholic. Give regular, small doses of Dr. Hess Stock Food, the great horse tonic. This will keep his digestion very strong and his appetite sharp; he will gain systemic strength rapidly and soon overcome the inclination to cholic. Along with this improvement in general health will come a sleek coat, readiness of action and increased strength. Dr. Hess Stock Food is invaluable in toning the reproductive organs—and in tiding the colt over the dangers of the first year.

It is formulated by Dr. Hess (M. D., D. V. S.), and is used by eminent veterinarians and endorsed by leading colleges. No unprofessional manufacturer can equal it. 100 lbs., $5.00 (except in Canada and points on Pacific coast); smaller packages at a slight advance. Sold on a written guaranty. For every disease and condition for which Dr. Hess Stock Food is not recommended, the little yellow card in every package entitles you to a letter of advice and special prescription from Dr. Hess.

Dr. Hess Stock Book, the authorative work on diseases of stock and poultry, will be sent free if you will write and state what stock, and how many head of each, you have; what stock food you have previously used, and mention this paper. Address Dr. Hess & Clark, Ashland, Ohio.

Above trade mark on every box.

NOW Is the time to Subscribe for HOARD'S DAIRYMAN.

at St. Louis, next year. The largest number of boys in my district who sent for corn were from Rock Island county, 154 of them, and the premiums offered them are well worth striving for, there is nearly, if not quite, $500 worth of premiums to be awarded.

I take this opportunity to thank G. W. E., of Bradford, Vt., for the kind notice he gives my silo plan; also thank G. L. S., of Dane, Wis., for what he was pleased to say on the same subject.

The article in the DAIRYMAN of the 9th inst. on page 785, entitled, A New Wrinkle in Silo Construction, will, if adopted by the writer, make wrinkles on his brow. I have used a silo built on the eight square plan for the past five years, and no amount of skill or precautionary measures would so pack the ensilage in the corners but what we lost a large amount in every corner.

My son who is in charge of the largest milk producing dairy farm at Burlington, Iowa, is now just in the midst of filling six Buff Jersey silos, whose combined capacity is over 1,000 tons. This son is our first graduate from the Only Self-supporting Agricultural College in the United States, and he has entered on a five-year contract at a salary that but few professional men on their first entering the field can earn net. Next spring we graduate two more of our sons. All of these boys lack some of the principal accomplishments that the average college graduate possesses. None of them can play foot ball, and never contracted the tobacco habit, or the habit of spending the old man's money in foolish ways, and as for the liquor habit not one of my boys ever drank a glass of beer or were inside a saloon, but with these accomplishments lacking I feel that they will be able to hold their own in the long run.

Monmouth, Ill. BUFF JERSEY.

CONCERNING OUR ADVERTISERS.

DRIED MOLASSES BEET-PULP.

This is the name of a new and valuable stock food that is being offered to the stockmen of this country. It is composed of the by-product pulp from making beet sugar and the molasses that is left after crystalization of the sugar. Beet pulp has been somewhat used as a stockfood, but in its natural condition it is 92 per cent water and contains but about ¼ of one per cent of sugar, showing that it is low in nutrients. Sugar is recgonized as of great value in fattening stock, and in making Dried Molasses-Beet-Pulp the pulp and molasses are so mixed that the finished product has 18 per cent of sugar. The food is dried in ovens and is clean enough for table use, and so palatable that all kinds of stock eat it from the first. Wet pulp is hard to keep and it cannot be transported more than a few miles, and must be fed at once or it will ferment and sour. The Dried Molasses-Beet-Pulp is dried until the percentage of moisture is not appreciable, except by chemical analysis and is put up in sacks that are easily transported. The food will keep in any weather for any length of time. When stock is fed on it, fattening is rapid because the food keeps the system in good order, the bowels regular, and the appetite good. For milch cows there is nothing superior to Dried Molasses-Beet-Pulp, as it increases the flow of milk and prolongs the period of lactation, keeping the flow of milk to the highest point during the time. It has been found that calves fed on it will keep in good health and will grow rapidly, while sheep and hogs could not possibly do better than when fed on this food. It has the advantage of being cheap, palatable, highly digestible, and easy to handle, and we believe it is destined to enter largely into stock rations fed by progressive farmers and stockmen.

VETERINARY PIXINE

"SAVE-THE-HORSE" SPAVIN CURE

$5.00 WITH WRITTEN GUARANTEE

It isn't words, type or page advertisements; it's the truths that ring out sound, clear and impressive—actual results from business men whose standing and reliability can be readily ascertained—which have made "Save-the-Horse" such a success. Their cured horses are living advertisements, absolute certainties as to the possibility in your own case, with every bottle is a guarantee document as binding to protect you as the best legal talent could make it.

The fire-iron invariably only aggravates the disease or injury, blistering is less effective; both necessitate laying up horse four weeks to several months. Mercurial and poisonous compounds produce irreparable injury.

"Save-the-Horse" eliminates these factors; Cures without scar, blemish or loss of hair, can apply at any time, anywhere, in all conditions and extremes of weather. Horses may be worked as usual with boots, as no harm results from destruction of hair or scalding of limb.

Positively and Permanently Cures Bone and Bog Spavin, Thoroughpin, Ringbone (except low ring bone), Curb, Splint, Capped Hock, Windpuff, Shoe Boil, weak and Sprained Tendons and all Lameness.

$5.00 per Bottle with written guarantee, constructed solely to protect you. Need of second bottle almost improbable, except in rarest cases. Send for booklet and copy of guarantee. If case is different than described in booklet or advertising we advise frankly of the possibility of the remedy effecting cure. Give particulars, state age, development, location of swellings, lameness, and describe way horse carries leg.

$5.00 per bottle at all druggists and dealers, or sent express prepaid.

TROY CHEMICAL CO., TROY, N.Y., ALSO MANUFACTURERS OF VETERINARY PIXINE.

What One Cow Has Done.

ED. HOARD'S DAIRYMAN:— I send you the record of one of my cow's milk, commencing Aug. 14th, 1902, and ending Sept. 10th, 1903. This cow is due to freshen Nov. 2nd, 1903. She gave in:

	lbs.	oz.
August, 1902	507	2
September	1070	
October	1100	
November	973	
December	894	
January, 1903	925	
February	869	2
March	935	2
April	767	
May	872	1
June	851	1
July	680	
August	398	2
20 days in September	109	1

This cow is 9 years of age last March, and dropped her first calf when two years of age, and has bred every year since She is a grade Durham and girts 6ft. 2 in. and is a very attractive cow. She is of a peculiar build and shows great dairy capacity.

I sell my milk at wholesale at 4 cts. a quart. This cow earned in her last milking period $194.72, out of which I deduct $60.00 which leaves $134.72 net. This record is no guess work, as her milk was weighed every milking. I have other cows nearly as good as this, and I will frankly state that HOARD'S DAIRYMAN and Professor Henry's Feeds and Feeding figure largely in getting so good results. H. L. MATHEWS.

Franklin Falls, N. H.

Schmidt Treatment for Milk Fever.

Will you publish the Schmidt treatment for milk fever? S. W. A.

Elizabeth, Pa.

About one-half pint of a solution of one drachm of iodide of potash to one quart of water, is injected into each teat, and distributed, by rubbing and manipulation, through each quarter of udder. The solution is allowed to remain for fifteen or twenty minutes, and is then milked out. This is repeated in four hours if necessary. In making the injection, a milking tube is used to which a piece of thin rubber hose, two feet long, is attached. In the loose end of this hose, a small funnel is inserted; this is held above the udder and the solution is poured into it and allowed to run slowly into the milk cistern and ducts.

Most careful attention must be paid to the cleanliness of the udder and hands, and the sterility of the instruments and solution. The solution must be made of freshly boiled, distilled water, and in a sterile bottle. The instruments, that is, the milking tube, the rubber tubing and funnel, must be freshly boiled and kept in a perfectly clean dish until used. The udder must be washed and the teats disinfected; and the hands disinfected before the milking tube is inserted. All these extraordinary precautions are necessary to prevent injury to the udder. If foreign matter or certain bacteria are introduced with the instruments or medicine, the udder will become inflamed and perhaps will be destroyed.

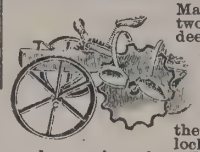
Clark's Tools for Large Hay Crops

CLARK'S REVERSIBLE

Bush Plow and Harrow

Cuts a track 5 ft. wide, 1 ft. deep. Connects the sub-soil water. It is an excellent machine for covering in sugar cane. Strength guaranteed. Can plow a newly cut forest, stump, bush or bog land, leaves the land true and clean for grain or any crop.

Clark's Dbl. Action Cutaway Harrow



Moves 15000 Tons of Earth a Day.

Clark's 8 foot Smoothing Harrow.

Will smooth an acre as true as a mill pond in twenty minutes.

Clark's Rev. Sulky Disk Plow

Made single or double. One or two furrows five to ten inches deep; 14 inches wide. For two or four horses. Light draft. No side draft. No similiar plow made. When Clark's grass tools are used as directed in his grass circular, we, the C. H. Co., guarantee them to kill wild mustard, charlock, hard hack, sunflower, milk weed, morning glory, Russian thistle or any other foul plant that grows, or money refunded, Now is the time to commence work for next year's seeding to grass.

Clark's Root Cutter.

TWO SIZES. Cuts 1 or 2 bushels per minute, for fowl or beast. Gouge cutters never choke or clog. Price $7 to $15.

Improved and Unimproved Farms for Sale

Farm No. 1 consists of 90 acres with frontage on a fine lake where there is excellent fishing and game. This lake is one of a chain of lakes on which you can travel for twenty-three miles. Has two-story house with eight rooms. Two-story log barn. Ice house and ten acres cleared. For sale at a bargain. One mile and a half from the railroad.

Farm No. 2. One-half mile from the railroad. 100 acres or more if desired, five acres cleared. Two-story, eight room house. Glass chicken house. First-class hog pen. Plenty of timber on land for own use, and quite a quantity of saw timber. We have besides this 16000 acres of unimproved land. Heavy black soil. All lies in Central Wisconsin. Low priced Excellent markets. Will grow any kind of crop and produce immense results. Excellent water supply. Splendid markets and a local demand for everything that is raised. None of the land lies more than three miles and a half from the railroad.

WISCONSIN FARMS

Will furnish names of people who have bought from us who have made big success. Can furnish lands in either small or large quantities. Can furnish reduced rates to see the lands. Easy terms to suit the convenience of the purchaser. As safe and desirable an investment as government bonds. Write in for maps and any information you may desire.

INTERIOR LAND CO., Janesville, Wis.

21 STRONG REASONS

WHY IT WILL PAY YOU TO BUY A FARM IN THE GREAT BLUE GRASS COUNTRY OF NORTHERN WISCONSIN.

1. The soil is rich and productive. Everywhere there is a clay subsoil to retain the moisture.
2. The climate is very uniform—neither extreme of heat or cold.
3. The seasons are regular and there is never a crop failure.
4. There is an abundance of wood for building and fuel, which need only to be cut.
5. Taxes are very low compared with other sections.
6. It is the best agricultural country known for a man of small means to get rich.
7. It is better to own a low-priced farm than to owe for a high-priced farm.
8. You can own a home in this section for what you now pay out for rent in one year.
9. Everything grown in the west can be grown on these lands.
10. There is an unsurpassed market for all farm products throughout the year.
11. Truck farming is very profitable in this section.
12. No better fruit country in the northwest. All northern varieties are wonderfully successful.
13. The best place in America to raise horses, mules, cattle, sheep and hogs.
14. The water supply is the best. The country is full of clear running streams and springs
15. Cereal crops average more bushels per acre than in other northern states. This may be said particularly as to oats, the average yield being from 60 to 80 bushels per acre.
16. Grasses and clovers for grazing or hay grow luxuriantly, far better than they do in southern Wisconsin, Iowa, Minnesota, or the Dakotas.
17. No swamps in this section—no malaria, no chills, no fever, no cyclones, no hail or destructive storms.
18. Fish and game in abundance. It is the sportman's paradise.
19. Lumbering and manufacturing interests offer ample employment at good wages whenever desired, both winter and summer.
20. Thousands of settlers are moving into northern Wisconsin, and in consequence land is increasing in value very fast.
21. The best class of people are among the settlers, which include principally Americans, Germans and Scandinavians.

DON'T PAY RENT, but come up and let us sell you a farm which will cost you but little more than the rent of a good farm in the older agricultural districts. Not only that, but a farm that will grow in value every day. Write us to-day for full particulars concerning these lands, and arrange to look them over at the earliest possible moment. They cannot fail to interest you if you want to get a home of your own. Mention HOARD'S DAIRYMAN.

WISCONSIN BLUE GRASS LAND CO., Baldwin, Wis.

LANDS IN AITKIN COUNTY MINNESOTA

Do you remember the time when your land was worth only $10.00 to $25.00 per acre? Now it is worth $50.00 to $75.00 per acre. History repeats itself. In Aitkin county the land sells today at $7.00 to $10.00 per acre, and is steadily going up. Why not take advantage of past experience and buy some of this land? Your father made money by purchasing land when it was cheap, why shouldn't you? Our terms are easy—Only one-fourth down; balance in 5 to 9 years. For maps and further information write to

L. B. ARNOLD, 838 Pioneer Press Bldg., St. Paul, Minn.

MURRAY'S LAND OFFICE,

WADENA, MINNESOTA.

LANDS EASY TO GET

I have lands, all good farming land, in Wilkin and Polk counties, Minnesota and Grand Forks and Burleigh counties, North Dakota, that I will sell on crop payment plan, with small cash payment of from $2.50 to $3.50 an acre cash down. Must sell. A chance of a lifetime. Investigate. For description and how to reach them, address

E. E. SECOR, Buffalo Center, Iowa

Answers to Dairy Questions by Prof. Farrington.

CHEESE DIVIDENDS.

Will you please give me some rule by which to find the value of milk that is sold to a cheese factory and paid for according to the amount of fat it contains? What is milk worth testing 3.7 and cheese selling at 10 cents a pound at the factory?
Sheboygan, Wis. L. H. B.

The method of paying for milk at a cheese factory by the Babcock test is a very simple one. All that is necessary for a cheese maker to do is to first take what are called "composite" samples of each patron's milk every day that milk is delivered to the factory. Second, about once in ten days these samples should be tested and from the weight of milk as shown on the milk sheet together with the test of these samples, the amount of fat which each patron has delivered to the factory in his milk may be determined. For instance, if you brought 585 pounds of milk to the factory in ten days, and the test of your composite sample of this milk during this time was 3.7, you delivered 21.6 pounds of fat to the cheese factory (585×.037=21.6). Such a record as this is made of the milk delivered by each one of the cheese factory patrons. At the end of the month the records of the factory will show how much cheese has been sold. The milk sheet and these tests will also show how much fat was delivered to the factory in the milk.

The next thing to do is to subtract a certain amount, which will include the running expenses of the factory, from the money received for the cheese and what is left is the amount to be paid the patrons for their milk. We will say that during the month 100,000 pounds of milk have been received at the factory and that this made 10,000 pounds of cheese which sold for ten cents a pound, which would amount to $1000; the running expenses of the factory may be $100, which subtracted from the $1,000 leaves $900 that is to be paid the patrons of the factory for their milk. The amount which is paid each one is now found by dividing this $900 by the total weight of fat in the milk delivered to the factory during the time this amount of cheese was made. Assuming that the average test of this 100,000 pounds milk is 4 0 per cent fat, the patrons delivered 4,000 pounds of fat to the factory, each one contributing his share as shown by the weight and test of the milk of each patron. The $900 is now divided by the 4,000 pounds of fat in order to find out the price of one pound of fat. This gives 22½ cents as the price per pound of fat to be paid each patron. The amount due you is found by multiplying your weight of milk, 585 pounds by its test, 3 7 per cent, which gives 21.6 pounds of fat, and this multiplied by 22½ cents gives $4.86, your share of the money received for the cheese.

This method of calculating dividends at a cheese factory is as simple as any one I know of and ought to be easily understood by the majority of farmers delivering milk to a cheese factory.

EFFECT OF RICHNESS OF MILK ON QUALITY OF CHEESE.

"If you will answer a few questions for me, I will be very greatful to you, as I wish to clear up a little argument between my cheese maker, my tenants and myself.

Has a cheese maker any power to prosecute patrons that make a practice of skimming their milk, but not skimming below the standard of 3.0 per cent, provided the milk is paid for by test?

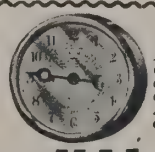
Would the different quality of milk affect the yield per hundred pounds of milk and consequenly affect the patron's income?

Does the market ever make any difference in price between cheese made from low per cent fat and high per cent fat?" A. G. M.
Hortonville, Wis.

Legal milk in this state must contain at least 3.0% fat. This I believe, is the only milk standard we have. The question of skimming milk so that it will contain 3.0% fat. should be referred to the Dairy and Food Commissioner, Mr. J. Q. Emery, State Capitol, Madison, Wis., for his ruling on such a practice.

The yield of cheese from milk testing different per cent fat, may be calculated by multiplying each pound of fat by 2.6, as it has been found by extensive experiments, that one pound fat will make approximately 2.6 pounds of cured cheese. This is an average figure and there may be some variation above and below it, depending on the amount of moisture in the cheese.

The approximate yield of cheese from a given quantity of milk, may be calculated by multiplying the weight of the milk by its test. This will give the lbs. of fat in the milk. Then multiply the lbs. of fat by 2.6, and the result will be approximately the weight of cheese that should be made from the milk.

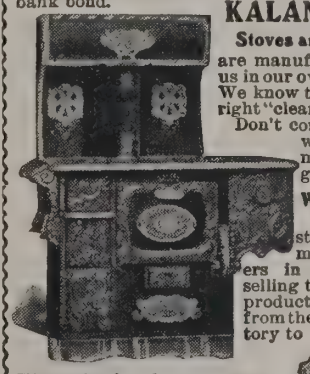


By making cheese from milk containing one per cent fat and from two, three, four and five per cent fat, it has been found that the yield of cheese increases with the richness of the milk. There is not an exact uniformity in the increase of the yield, because milk containing six per cent fat will not make twice as much cheese as milk containing three per cent fat, but under normal conditions, factories do not usually receive milk of these two extremes. It varies probably from 3.5 to 4.5 % fat. The cheese value of milk may be, therefore, very closely determined by the Babcock test, at the majority of factories-

Cheese made from milk testing 3.0 per cent fat is greatly inferior in quality to cheese made from rich milk containing 5.0% fat. I am sure that the markets would notice the difference in the quality of cheese made from these two kinds of milk, and would undoubtedly pay a higher price for that made from rich milk. When, however, the richness of the milk from different patrons runs between 3.5 and 4.5% fat, the probabilities are, that there will not be much difference in the quality of the cheese made, but I think if in your factory you will make some cheese of milk testing 3.5, and another lot from milk testing 4.5% fat, you will notice the difference in the quality of the two cheeses, and by giving both the same treatment in curing and shipping, you will find that the person to whom they are sold, will note the difference in quality and undoubtedly pay you more for the cheese made from the richer milk.

MOLDY BUTTER.

"We have had several complaints from our commission men about mold on our tubs and at times on the inside of the tub through linings and on the butter. Can you give me the cause of this and a remedy for same?" J. H. W.
Highland, Wis.



The mold spores which cause butter tubs and parchment paper linings to mold are everywhere present. They are only waiting favorable conditions of temperature and moisture to sprout and grow on a moment's notice. It is necessary, therefore, in order to prevent their growth and the damage done by them, to keep butter tubs before and after they are filled, in a place which is unfavorable for the growth of molds. This, as a rule, means simply keeping the butter in a well ventilated place where the air is dry. The great loss on butter from mold is usually caused by the damp refrigerators at creameries, or the damp refrigerator

All Kalamazoo ranges and cook stoves are equipped with patent oven thermometer. Makes baking sure and easy.

Time to Eat

finds your stock ready to eat if you feed them the genuine

Alma Dried-Molasses BEET PULP

It is not refuse matter but is a by-product food of greatest value, made with the same cleanliness and accuracy as the sugar itself.

We have a booklet telling how this food is made. Ask for one; it will interest you.

It is superior to the many patented "stock foods" as it is a natural product and contains no drugs or dangerous ingredients.

Better than bran and costs less. Keeps the animals in prime condition and when fed with grain is the best fattener known because it improves both appetite and digestion.

E. C. Cummings, Carson City, Mich., writes: "Send 2 tons first freight. Am feeding 35 steers to top the market. This is my 6th order."

It is the best food for milch cows; splendid for calves. All stock thrive on it.

Do not confuse this with wet beet pulp which freezes and ferments, or with common dried pulp containing no additional sugar. It takes 16 tons of wet pulp to make one ton of our Food, and it keeps indefinitely. The genuine Alma Dried-Molasses Beet Pulp contains 72 times as much sugar as wet pulp, and nearly 5 times as much as common dried pulp.

Alma Sugar Co.
Dept. 6 Alma, Mich.

CUTTERS AND BLOWERS.

Built on the right principle. Without any air blast the ensilage would be thrown 15 feet. Only a light blast required to do the rest. "They throw and blow." Also horse powers, engines, silos, etc.
HARDER MFG. CO., Cobleskill, N. Y.

cars in which the butter is shipped to customers.

In preparing butter tubs for filling it is best not to soak them over night, as this will often break the hoops and change the shape of the tub. On account of this warping the tubs may be immersed in scalding hot water the night before they are used. This soaks the tub so that no hoops will break, but the hot water will enter the pores of the wood and kill the mold spores. After it has been heated in this way, it is a good plan to sprinkle the inside of the tub with salt and let it stand empty over night. In the morning steam each tub for at least three minutes over a steam jet, fill with cold water and let them stand until you are ready to fill with butter.

The parchment paper ought to be soaked in brine over night before it is used in the tubs. When both the tub and the paper are treated in this way and the butter tub after it is filled is kept in a dry refrigerator where it may be cold but not damp, there ought not to be any complaints in regard to moldy butter.

Butter Tests Accepted for Publication by the American Jersey Cattle Club, Oct. 1st, 1903.

Chief's Bright Eyes 147382—Sire, Chief of the Cliffs 22028; dam, Highland Sunbeam 41870. Butter, 15 lbs., 8 oz.; milk, 209 lbs., 9 oz. IS YOUR STOMACH ON A STRIKE?

There is Nothing to Prevent You Employing a Substitute to Do its Work.

There is such a thing as forbearance ceasing to be a virtue even in the case of one's stomach. There is no question but that some stomachs will stand a great deal more wear and tear and abuse than others, but they all have their limit and when that limit is reached, the stomach must be reckoned with as sure as fate. The best way and really the only effective way to treat your stomach when it rebels is to employ a substitute to do its work. This will give the weakened and worn-out organ an opportunity to rest and regain its strength and health.

Stuart's Dyspepsia Tablets relieve the stomach of its work by taking up the work and doing it just as one set or shift of workmen relieves another. They actually digest the food in just the same manner and just the same time as the digestive fluids of a sound stomach do. In fact, when dissolved in the stomach, they are digestive fluids for they contain exactly the same constituents and elements as the gastric juice and other digestive fluids of the stomach. No matter what the condition of the stomach is, their work is just the same. They work in their own natural way without regard to surrounding conditions.

The stomach being thus relieved by Stuart's Dyspepsia Tablets, is restored and renewed by Nature and the rest of the human body does not suffer in the least by reason of its failure to perform its work.

A Wisconsin man says: "I suffered the pangs of dyspepsia for 10 years. I tried every known remedy with indifferent results until I was told of the remarkable cures of Stuart's Dyspepsia Tablets. I bought a box, began taking them and forgot I had a stomach. Three boxes cured me completely. I have had no trouble whatever for a year and have an appetite like a harvest hand and can eat anything that is set before me without fear of bad results."

Stuart's Dyspepsia Tablets are for sale by all druggists at 50c a box. The druggist never fails to have them in stock because the demand for them is so great and so pronounced that he cannot afford to be without them. People who could not get them from one druggist would go to another and would get in the habit of buying their other drugs there as well as their Stuart's Dyspepsia Tablets.

That Difficult Task.

(Continued from page 794)

gressiveness and culture of its inhabitants, the character of its buildings and improved lands, stability of its business institutions, sound financial condition of its municipalities, the fact that the county has the highest average of populous towns of any county in the state, and that those towns have the highest average of population in the state—all tell the story of Franklin county's contentment. This northwest corner of Vermont, including our neighbor county in the islands, is one of the most beautiful spots on the footstool, and it is little wonder that its inhabitants dwell in plenty and pride.

E. R. TOWLE.

Franklin County, Vermont.

Despising His Business.

ED. HOARD'S DAIRYMAN:—I do not think that H. C. R. in Sept. 18th DAIRYMAN is quite right. There may be farmers who despise their business, but I do not remember that I ever saw one. The successful farmers I know all seem to take pride in their work. They are thinking men and are ambitious and progressive. If a man despises his business it seems to me he cannot possibly succeed in it. On the other hand, if he is successful he is not at all likely to despise his work. It is perfectly natural that the creamery patrons we read about, who lose money on every dollar's worth of feed they use, should despise farming. It would be strange if they did not.

As to farmer's wives despising farming, perhaps a good many of them do; but why is it? Is it not because they have to work hard and never have any good times, and because they have no spending money of their own, and have debts to worry about, or a mortgaged roof to live under? Debts and mortgages are common in town and city, and the chances are that these unhappy farmers' wives would be just as unhappy if they lived elsewhere.

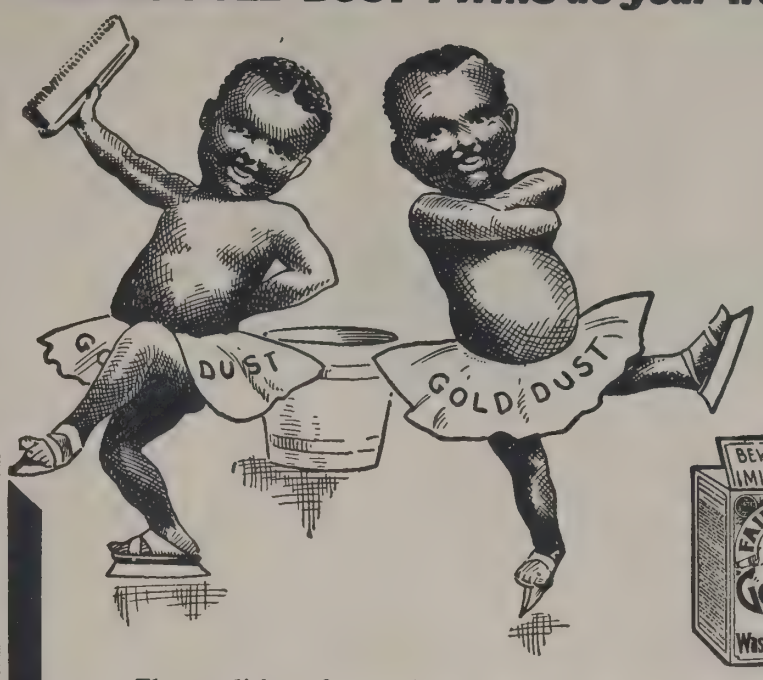
The wives of successful farmers, who do not have to overwork, and who have the comforts and conveniences that a little money brings, will be found a contented class as a rule.

Now and then one will be found who takes a keen interest in all the farm operations and is as enthusiastic as her husband. But again one will occasionally be found who is restless and discontented—and who would be, under any conditions in the world.

In these days of R. F. D. routes, and when the best magazines can be got cheaply by clubbing, with labor saving machinery both indoors and out, and so many things to make life comfortable and interesting, there must be something very wrong with the farmer himself if his sons and daughters do not find the farm life attractive.

As for my own personal opinion on the subject: If the individuals of each class are honest, temperate and moral, I have fully as much respect for a successful farmer as I have for a successful doctor, lawyer or minister. I am a farmer myself, and the only reason I have for being the least bit ashamed of it is that I am not a better one. SUSAN B. ROBBINS.

Abington, Mass.



Pasteurizing Cream.

ED. HOARD'S DAIRYMAN:—Can a small quantity of cream, say two gallons, be successfully pasteurized by setting in water and keeping stirred? What temperature gives the best results without cooked flavor? Is it better to raise temperature slowly? M. D.

Morris Co., N. J.

The best results in pasteurizing are obtained by heating quickly and cooling with equal quickness. Heat to 140° F. and hold at that temperature for 20-30 minutes, then cool rapidly by running cream over a cooler if possible, or otherwise setting the can of hot cream in cold water and stir the cream constantly. It will be necessary to renew the water several times to get the cream down to 50° F., which is necessary for successful pasteurization. Ice helps very much in cooling as it acts quickly, and there is less water to be handled. If the cream is not heated above 140°, F. and is cooled rapidly, there should be no cooked taste.

MY RUNT GAINED 100 LBS. IN 6 WEEKS

OAK MOUND, MO., Sept. 9, 1902.

International Stock Food Co., Minneapolis, Minn.

GENTLEMEN:—I am well pleased with your **"International Stock Food."** This spring I had a little pot-gutted runt of a pig that I considered worthless. As an experiment to see what **"International Stock Food"** would do, I put this runt of a pig in a pen and commenced feeding him according to your directions and in six weeks I had a chunk of first-class pork weighing 100 lbs. more than he did six weeks before. **"International Stock Food"** keeps my horses, cattle and hogs perfectly healthy.

Very truly yours, N. C. BROWN.

☞We Have Thousands of Similar Testimonials and Will Pay You $1000 Cash to Prove That They Are Not Genuine and Unsolicited.☜

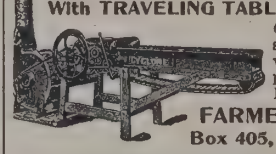
THE SMALLEY SHREDDER

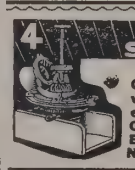
FOR EITHER GREEN OR DRY FODDER



Gives fodder the greatest food value, and makes it easier for the animal to masticate and digest. Requires least power; strong and durable; will outlast a dozen of the saw pattern kind. Knives adjustable to compensate for wear. We can furnish snapper rolls to remove all the ears, just the same as a husker. This combination of cutter, shredder and snapper, costs but little more than the ordinary cutter. We also make drag and circular saws, sweep and tread powers, and ensilage cutters with carriers or blowers to reach any silo. Our free catalogue tells all about our goods. Address Box No. H.

SMALLEY MFG., CO. Manitowoc, Wis.

CYCLONE FEED AND ENSILAGE CUTTER



With TRAVELING TABLE and BLOWER

Guaranteed to cut split, shred and elevate ensilage 50 feet perpendicular height For catalog address

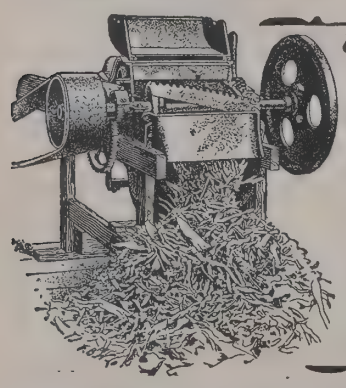
FARMERS MFG. CO.

Box 405, Sebring, Ohio

4 HORSE and 2 Horse SWEEP MILLS

And Horse Power.

Grinds corn with shucks, rye, barley, wheat, oats and all other grains. **Self feeders. Geared 7 to 1. Light draft. Great Capacity.** (Also make plain sweep and **Belt Mills;** 10 sizes.)



N. P. D. Bowsher Co., South Bend, Ind.

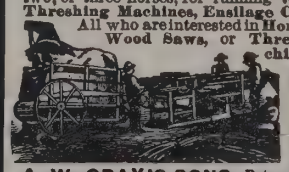
The Fearless Railway Horse Powers

run easier and yield more power than any other. Suited to *Cutting, Sawing, Pumping, Threshing*—all farm uses. Also Threshers, Engines, Cutters, Saw Machines, Round Silos, etc. Catalogue free.

HARDER MFG. CO., Cobleskill, N. Y.

The 1903 Shredder Blades

(Patent Applied for)



make efficient shredders out of "Ohio" Feed and Ensilage Cutters. The **New Shredder Blade** is the regular "Ohio" knife with solid integrally projecting bits which cut and tear corn stalks into a nicely shredded condition, as shown in the picture. It makes corn-hay of the fodder.

Shredder Blades are interchangeable with knives on all sizes "Ohio" Cutters. They successfully reduce fodder to the proper condition and do not pulverize the leaves like other styles. **They shred** with the same power, speed and capacity as "Ohio" Cutters, and either the Chain or Blower Elevators handle the shredded corn perfectly. **Speed,** 600 to 700 revolutions. **Power,** 2 Horse Tread up to 12 h. p. Engine according to size. Let us send the 1903 catalogue of "Ohio" Cutters and Shredders. "Modern Silage Methods" 10c, coin or stamps. Manufactured by **THE SILVER MFG. CO., Salem, Ohio.** *Established 1854.*

HORSE POWERS

Threshing Machines. Wood Saw Machines.

GET THE BEST. Horse Powers for one, two, or three horses, for running **Wood Saws, Threshing Machines, Ensilage Cutters, etc.** All who are interested in **Horse Powers, Wood Saws,** or **Threshing Machines** and **Ensilage Cutters** are invited to write for fifty-page pamphlet. It's free.

HEEBNER'S "UNION" FEED AND ENSILAGE CUTTERS

are the only thoroughly up-to-date machines in dry fodder cutting. They cut and crush at one operation. Prepares the nutritious lower stock, making an excellent and much relished food. No waste. Easy to masticate. It is easier to grow two tons of fodder than one ton of hay on the same ground. Fodder is equal to hay in feeding value. The corn itself is clear gain. *Shredding attachment for* $5.00. You then have cutter, crusher and shredder combined in one. Not much more expensive than other machines, but far more valuable. Send for *free* booklet.

HEEBNER & SONS, 20 Broad St., Lansdale, Pa.

FEED GRINDERS AND COOKERS

Most perfectly adapted to wants of feeders. Feed goes twice as far and makes better beef. Our

Giant Killer Triple Geared Feed Mill

is the fastest sweep mill made. Light running and grinds ear and shelled corn and all grains coarse or fine. Strong and durable.

Northwestern Steam Cooker

leads all others. Return draft, quick steaming, large capacity. Don't buy either mill or cooker without seeing our descriptive circulars. Write for them today.

....A....
Separator Show Down

Ever stop to think why the "bucket bowl" separator fellows use hot air—avoid facts? Because they know their machines are antiquated—out of date—skinned to a finish—by the Tubular. That's why they talk all around the points of construction—but carefully avoid mentioning their back-breaking, high supply cans—their top heavy bowls, filled with contraptions—their clumsy gears—their aggravating oil cups. They leave facts to the Tubular. They know a show down on construction alone would prove Tubulars take the trick.

TUBULARS TAKE THE TRICK

When you see a separator with a supply can a six year old child standing on the ground, can look into—it's a Tubular! No other separator has a low supply can. When you see a separator a ten year old child can feed without climbing on a box or ladder—it's a Tubular! Other separators need stairs for the supply can. When you see a separator that requires little room—little labor to turn—little time to wash—that will run for years without costly repairs—it's the Tubular.

For Tubulars have simple three piece bowls that can be washed clean in three minutes—Tubulars won't vibrate and can't bind—Tubulars have entirely enclosed, absolutely safe gears—Tubulars have no oil cups—Tubulars will cut in half any record for clean fast skimming made by any other machine.

Catalog No. 144 tells all about the Tubulars.

More Opinions on Farm Life.

ED. HOARD'S DAIRYMAN:—I would like to say in reply to the article of H. C. R., in your issue of Sept. 18, '03, to succeed anywhere one must work and study. On the farm we have hard work there is no question, but into what occupation or profession can you go and succeed without hard work? But the fact that has impressed me the most forcibly, is how little farmers study the conditions of their own business. I am firmly convinced that if a young man would give the same amount of work and study to a farm, as he would to any other business, he would make as great a success of the farm as of any other line of business.

I cannot agree with H. C. R. or anyone else about despising labor. All literature, from the Bible down, is full of the dignity of labor. No one can succeed anywhere without labor, but we must labor with our head as well as with our hands.

As an illustration of how little some farmers know of their business. I attended a county fair in the western part of our state, last week, and met a dairyman who had a nice lot of Holstein cows there. He told me how he had lost four calves last winter through feeding cotton seed. If he had studied the question at all, he would have learned that cotton seed is death to calves and pigs. Certainly there is no more interesting study, and for the dairyman no more profitable study than the feeding problem. Yet how many farmers you can meet who cannot even tell the proportions of a balanced ration.

Instead of being in such a hurry to leave the farm, let the young men take a winter course at one of our Agricultural Colleges, and then put his knowledge into practical use on the farm.

That conditions are improving in the country, no one who watches country life can doubt, with the Rural Free Delivery, Country Telephone, Good Roads, the isolation of the farm is being done away with, and last but not least the establishment of Agricultural Schools and the consolidation of the district school has brought about the time that every country boy can take his place among the business men of the country and be proud to say, "I am a farmer."

There are two articles in the current "October" number of the *Review of Reviews*, "The New Education of Farm Children" by Prof. W. M. Hays and "Learning by Doing for the Farmer Boy" by Supt. O. J. Kern, that tell of the steps taken toward the improvement of country schools and teaching methods. The ideas there advanced meet with my hearty approval, and I wish that the two articles could be placed in every farm home in this country, and their methods adopted in every state and locality.

In closing let me state that the best practical help that I have found for the study of farm problems has been HOARD'S DAIRYMAN.

Utica, N. Y. L. C. WILLIAMS.

Officers of the Illinois Jersey Cattle Club.

ED. HOARD'S DAIRYMAN:—The following officers were elected by the Jersey Cattle Club of Illinois at their annual meeting recently held in Springfield: President, Euclid N. Cobb was elected to succeed himself. He is our Buff Jersey. Vice President, J. F. Lattimer, of Abington; Secretary, Walter R. Kimzie, of Tamaroa; Treasurer, J. W. Whitson succeeds himself, Rushville.

Owing to a misunderstanding as to place of meeting, the attendance was not as large as it would have been.

Mr. Wheaton's Canadian Dairy Notes.

Canadian Cheese Making—Market Conditions—Foreign Cheese Trade—Canadian Butter—Prof. Dean's New Book on Dairying.

Ed. Hoard's Dairyman:—It is not so very long ago that the leaders in dairy thought and practice in Canada were advising the curtailing of the manufacturing of cheese lest the British market be overdone and the price of cheese reduced below the profit line. But that advice was not acted upon, and Canada is to-day making more cheese than was ever dreamed of a decade ago.

Contrary to the expectations of many, this large increase in the make has not reduced the price. The price is higher this season than it has been for some years, and 1903 will go down to history as a record one, so far as the cheese industry is concerned.

In the later years of the last century, we were exporting over 60 per cent of all the cheese imported by Great Britain, an achievement, then looked upon as nothing short of a marvel, considering the comparatively short time we had been in the business. But what will be thought of the present day record? The latest official import statistics of the United Kingdom show that during August last 349,000 cwt. of cheese were imported, of which quantity Canada supplied 300,000 cwt., thus almost monopolizing Great Britain's import trade in cheese. According to these figures we are sending forward over 85 per cent of the cheese imported by Great Britain. If this demand keeps up until this season's make is disposed of, as it likely will, we shall have little enough to meet the needs of this growing trade.

The market on this side has been of a varying character the past few weeks. As the end of the season approaches there is always more or less speculation. A few weeks ago speculators boosted prices up to a 12 cent basis. Last week there was a decided falling off from these values and prices dropped from ⅜ to ½ cent per lb., leaving the market steady at from 11¼ to 11½ cents per lb.

These are good values for the fall make and are about as high as the old country market will warrant at the present time. A strong and keen demand is needed to make goods go off briskly in the English retailer's shop at anything over the six-penny cut. Of course, at present prices here, values will have to go considerably above that figure to enable the shipper and middleman to realize a living profit. But the fact that the demand keeps up, even at these high values, is pretty strong evidence that Canadian cheese is wanted, and wanted badly by the English consumer. Producers on this side will be acting wisely if they do not ask too high figures, lest this splendid, active demand receive a severe check

One or two Canadians who have recently returned from the old land have been warning Canadians to be on the lookout lest their splendid cheese trade be wrested from them by other countries. Of course they failed to name any particular countries that were trying to get in on the ground floor in the British cheese market. In the face of the present demand and good prices, however, it does not look as if we had anything to fear in this regard. Canadian cheese has obtained such a strong foothold in the British markets that it will take some effort and push to supplant it, even to a very small degree.

Not so much can be said of our butter trade. These same parties state that Canada is likely to be supplanted altogether in the British butter market if we do not get a hustle on. The country that is going to do this is Russia, which is today increasing her exports by leaps and bounds as it were.

And this question should be given some concern by Canadian butter makers. We are not gaining and hardly holding our own in the British butter market at the present time. Of course there are one or two reasons for this. The experience of the past few years has shown that when cheese is up butter is down. This year the farmer is going in for cheese more largely than ever before and of course the butter side of the business has to take a back seat. Besides, early in the season and up to within a couple of months ago, the home market afforded a more profitable avenue for disposing of the product than the export market would warrant. And as the supply was not as large as usual, butter manufacturers found little difficulty in finding a profitable outlet at home.

But all this may be a little aside from the question whether we should make greater effort to enlarge our butter market in Great Britain. Considered in the light of future needs we certainly should make a stronger effort than we are now doing to develop this market. Even if our cheese trade continues to grow as it is now doing, it will soon have supplied England with all the cheese she needs from outside sources. When that point has been reached the surplus will have to find a market elsewhere. But where, is the question. The only outlet is to convert it into export butter. Therefore in view of this contingency, if for no other, there should be no slacking of effort in pushing the sale of Canadian butter in the old land.

To do this successfully, regular quantities must be sent forward and the quality must be of the finest. As to the former, at least, our butter trade has not yet reached a point where the British consumer can rely upon getting Canadian butter in regular and stated quantities. One week he may be able to buy it and the next perhaps there is none to be had, and he must perforce seek his supply in some other brand. One of the great secrets of success in our cheese trade is due to the fact that Canadian cheese is always for sale in Great Britain and can be depended upon. When our butter trade has reached that position it will require as little effort to hold the market as is the case today with Canadian cheese.

While Canada has been for years to the front as a great dairy country, we have had to go elsewhere for text books or works on the subject. But this state of affairs has been brought to a close. There has recently appeared on the scene a most interesting and valuable work entitled, "Canadian Dairying," which is destined to prove most useful as a factor in promoting better dairying methods in Canada. It is edited by that versatile and progressive teacher of dairying, Prof. Dean of the Ontario Agricultural College. The book bears upon its pages the result of careful thought and apt selection of matter. It is designed primarily for the use of the student in the dairy school or agricultural college, but is, nevertheless, a work of great value for the dairy farmer and for the maker of cheese or butter.

The information contained in the book is arranged under two main headings—dairy farming and co-operative dairying. The breeding, feeding and caring for the dairy cow, the caring for milk and cream, and the details of cheese and butter making, are given in concise and convenient form. The illustrations are apt and the work, though nothing entirely new is set forth, is of value in that the most up-to-date and reliable data on the subject are presented in a readable and adaptable way.

An important conference of dairy instructors and teachers will be held at Ottawa on November 4-6 next. This conference is being called by Mr. J. A. Ruddick, Chief of the Dairy Division, Ottawa, for the purpose of discussing matters of importance to cheese and buttermakers. Among the subjects to be discussed are "Cool Curing of Cheese," Pasteurization in Relation to Butter Making," "Transportation of Dairy Products," etc. A similar conference was held a year ago, which proved most useful and instructive. The coming one should prove equally so, if not more valuable.

Mr. J. W. Mitchell, B. A., has been appointed to succeed J. W. Hart, of Illinois, as superintendent of the Kingston Dairy School. Mr. Mitchell's education and training has been such as should eminently fit him for this important position. A graduate of the Queen's University and later of the Guelph Dairy School, where for several years he was an instructor, coupled with a wide experience in the Northwest and in Nova Scotia, on Prof. Robertson's staff, should give a training that makes for success as a teacher of others. The Kingston school will, no doubt, continue to be the important factor it has always been in Eastern Ontario dairying, under his supervision.

A new market for Canadian butter is likely to be developed in Japan. Owing to the direct result of Canada's exhibit at the Osaka exposition three new customers have recently been secured for butter made in the Government creameries in the West. The amount of butter exported to Japan by the Dairy Division, at Ottawa, is now three times what it was at this time a year ago.

Mr. J. A. Kinsella, who succeeded Mr. Ruddick as Dairy Commissioner for New Zealand a few years ago, has resigned and gone to superintend dairy work in the Transvaal, South Africa. Mr. Kinsella is a Canadian who received his training in Canada.

J. W. Wheaton.

Toronto, Canada.

JERSEY COW, LORETTA D, A. J. C. C., 141708.

One of the cows on trial for the St. Louis Fair. Property of F. H. Scribner, Rosendale, Wis.

Weed Out the Poor Cows.

For the last two or three years farmers who have made dairying a prominent feature of their farm operations have had the long end of the double-tree. They have had good prices for butter, good pastures, and have been able to utilize their soft corn and their corn fodder better than any other class of farmers. They have been making money right along. They are not, however, as a rule, making more than half the money to which they would be entitled if they adopted up-to-date methods. The two big leaks in the dairy business, as connected with general farming, are poor cows and unbalanced rations.

We have been urging farmers to weed out the poor cows for the last ten years, and we have been little more in all these years than the voice of one crying in the wilderness. Farmers keep on with their poor cows and lose half the profits of dairying rather than go to a little trouble to get acquainted with their cows—not with their outward appearance, but with their actual capacity. We have begged and pleaded and sometimes almost scolded, and felt like giving it up, but we would try once more.

The great trouble with the farmer is that he does not think he has the time to weigh and test and find out what cows are paying and which are dead-beat boarders. We do not look for any great reform until either the creameries or the experiment stations take the matter up and help the farmers to help themselves.

The Illinois Experiment Station has already done this and the results are just what we would naturally expect, surprising as they may be to farmers who have not given the subject study. Bulletin No. 85 of that station gives the results. Eight farmers, whose herds contained 176 cows at the beginning of the year and 144 at the end, co-operated with the station. The plan was a very simple one: The farmer agreed one week in seven to milk each cow, weigh the milk separately, take a sample. put it in a jar, add a little corrosive sublimate, and send these at the end of the week to the experiment station for analysis, the station furnishing the scale and the cans, the milk sheets, and a small dipper or milk thief for taking the sample. The year was divided into seven-week periods and the samples were taken each fourth week, and from the results of these analyses, giving the per cent of the butter fat for the week, was calculated the yield, assuming that this fourth or middle week would be a fair average of the weeks preceding and following.

Some of the farmers state that the time occupied in this was very little; others complained that it took too much time to do the work. It takes on an average a minute to each cow, or two minutes a day, and for the entire year takes about one hour and thirty-eight minutes of the farmer's time to get a complete record of each cow in the herd. The farmer who is not willing to take that much time had better quit the business.

Our readers may be interested in knowing the results in a general way. Some of the herds returned their owner a good profit, others a small profit, and one herd no profit at all. Six herds out of the eight contained cows which did not pay for their feed. The cow that gave the most profit made 472 pounds of butter. A dozen cows of that kind would make a man rich. The poorest cow gave sixty-eight pounds of butter. A dozen cows of that kind would bankrupt the

owner. The average production of all the herds, omiting one that had been tested for years and all the poor ones thrown out, was 202 pounds of butter. The most profitable cow gave a net profit of $57.22, assuming that the calf paid for her keep when dry and the skim-milk paid for the labor. The poorest cow was kept at an actual loss of $17.83 The average net profit was $9.96.

The station says: "The above facts show clearly that the average production of the Illinois dairy cow can be doubled and the profit increased fourfold."

We hope that the experiment stations in every state can take up this line of work and hence force farmers to see and stop the great leak that occurs in farm profits by the keeping of poor cows, and, as we have often stated, the only way known to find out whether a cow is a poor cow or not is to weigh and test the milk. To show what can be done in this line, we call the attention of our readers to Bulletin No. 76 of the University of Nebraska. It has a dairy herd made up of grade Jersey heifers bought in Wisconsin in 1876, costing $32 per head. It has been using full blooded Jersey sires on this herd ever since. The average yield in butter of this herd for 1897 was 340.-98 pounds; for 1898, 368.89 pounds; for 1899, 247.03 pounds; for 1900, 279 35 pounds; for 1901, 353 43 pounds; or an average for five years of 315.82 pounds.

This is more than can be done with the average dual-purpose herd, such as is kept on most farms that patronize creameries, but not so much more as one would naturally expect. The herd of Mr. Norton, of Iowa, has averaged more than 300 pounds for many years past and it is made up largely of grade Short-horns and other cattle of that type. There would be no difficulty whatever in securing inside of two years a herd of dual-purpose cows that would yield 200 pounds of butter per year, nor would there be any great difficulty in raising this by weighing, testing and proper feeding to 250 or even 300 pounds. Every farmer who has ever milked cows knows that this would pay, and pay well. It is clearly within the reach of any man who is patronizing a creamery, to have a herd of this kind if he will do just two things: Weed out his poor cows in the way in which we have suggested, and then feed a balanced ration, of which more hereafter.—*Wallace's Farmer.*

Farm and City Life.

ED. HOARD'S DAIRYMAN:—I would like to have my little say regarding what H. C. R. says on page 717. "Most of the farmers, dairy farmers as well as the rest, despise their business, their wives despise it, the daughters despise it and their sons despise it." Now I am, or rather was, a city man, being born and raised and lived in a large city the first forty years of my life. I have spent the first past twenty-eight years in farming and dairying on my own little farm of thirty acres, and never during that time have I desired to change my occupation.

Whenever I see in the farm papers that I take, anything that I consider exceptionally good, I cut it out and paste it in my scrap-book. Referring to said scrap-book I find the following clipping from the *Farm Journal*, of some years ago, which I think is good enough to be told over again. The writer says: "I do not live on a farm, or any where near one. I work at my trade here in town, and if any of your discontented farmers want to exchange a little farm for my job they are welcome to it. In winter we go to work in the dark and come home in the dark. If a man lives far away from his work, he must be up early every work day of the year at 5:30 and 6, take his dinner with him, and then get home at 6:45 and 7. Then he must work every work day in the year if he wants to live. Where is the farmer who knows what this means? If they had to plow or harvest every day in the year, then they would know. Why, an industrious farmer lives like a bank president compared to an industrious tradesman.

Let me enlarge on this subject. A tradesman will make from $1.50 to $3 a day, the small wages are made by the man who is given work all the year round, the higher wages are made by the one whose occupation will not permit him to work all the year. In order to get these wages, the tradesman must depend on someone else, the farmer depends on himself alone. In that one difference the farmer compared with us, is as independent as a millionaire. To get even these wages, we must band together in unions, and often have to strike in a body to keep from being cut down. The only strike the farmer must go on, is to refuse to sell his eggs or berries for less than they are worth. It will take about all a tradesman can earn, if he wants to live comfortably. If he wants to save to buy a lot and put up a house, he must deprive himself of many things, and the way he does it is to live on cheap food. The farmer can get the very best and in abundance.

In this particular, again, is the farmer's calling shown to be the best of all occupations, for what else can a poor man get out of this world but a place to sleep and something to eat. Why, the price we pay for strawberries for one week, would keep the farmer in fresh and canned strawberries for a whole year.

There is another item that shows the superiority of country over village life, and this is a truth that should be considered thoughtfully. If a man in town by stinting himself a dozen years, saves enough to buy a lot and build a house, the both being worth say $2,000, in the end he has only a place to live in and must still depend on someone else to give him work. Now, if that money had been put into a ten acre farm at $100 an acre he would have had a business of his own, something that he could get a living out of, as well as a place to live, as the profits should pay for the house and land."

But changing the subject, I want to tell about a new addition of five stalls I have made in my cow stable. They are patterned after the "Model Stall," so often described in the DAIRYMAN, with a few slight variations. The front part is made from the description that has been given by John Gould, of those he has in use, neck chains for fastenings instead of halters, the low down manger instead of the hay rack, and moveable feed box with the 2×8 plank over the cows' necks to prevent them from stepping into the manger.

There is no sunken gutter in the rear, only that formed between the two 3×4s. If the 3×4 scantling at the cow's hind feet be spiked to the floor at the proper distance from the manger, depending of course upon the size of the cow, she is compelled to keep clean, whether she wants to or not. Then, if the other 3×4 is placed on a slant, on the same principle as the gutter on the roof of a house, and a barrel sunk in the ground, so that the liquids can run into it, the platform will be comparatively dry all the time.

The contents of this barrel can be either baled out or pumped out as occasion may require, and used as a liquid manure, or spread over the manure heap. I should have stated that there is just two inches of fall, from the front of the stall to the back platform at the rear. I am so well pleased with these cow stalls that I should certainly duplicate them were I to need any more or alter any of the old ones. J. T. M.

Brandywine Summit, Pa.

An Old Fraud.

ED. HOARD'S DAIRYMAN:—I was somewhat surprised a few years ago when an agent for a compound containing borax came to the Wisconsin Dairy School and tried to sell us some of his preservative to use in milk and other dairy products in which we are interested. I was surprised because of the audacity the man showed in attempting to induce such an institution as this to buy and promote the use of a compound which is prohibited by state law.

I presume all dairymen know that there is a law in the state of Wisconsin forbidding the addition of any substance to milk for the purpose of keeping it in a sweet condition until it reaches the consumer. Such preservatives are simply an attempt to cover up the neglect and the lack of cleanliness which often causes milk to sour when it is shipped to cities or delivered to creameries and cheese factories.

I received somewhat the same shock today as was given me by this man who tried to sell us a preservative for our dairy school products several years ago The agent who visited us today was promoting the sale of a compound which he claimed would increase the weight of butter seventy-five per cent. He stated that to convince me of the great value of his method and patent process, he would place butter in a churn, add three-fourths of a pint of milk to every pound of butter, then use a small quantity of his patent substance and make a product which

BELLOWS FALLS, VT.

BUHL CANS ARE NOT
Like Other Milk Cans
Because They Are Better

This is equally true of the **Buhl Factory, "Improved Elgin" and Genuine Iowa Cans**; superior material, design, workmanship, and smooth finish combine to produce those **long wear** qualities for which the **Buhl Cans** are so renowned. **Remember** the Buhl is the only can in the world that is made with the BUHL "VICTOR" CAN BREAST and the BUHL "VICTOR" ROUND HANDLE. They may cost a little more than common cans—we do not know, for we cannot tell how badly "the trust" and others are beating you. We know that the small added cost of the **Buhl Cans** will prove the best can investment you ever made. Every can that is stamped with our famous Milk Can Trade Mark, as shown here is a genuine **Buhl Can.** The mark is a guarantee of all around excellence. Ask your local dealer for **Buhl Cans.** If he does not have them he can get them for you. Write us about it. We will see that you are supplied.

Buhl Stamping Company, 212 W. Larned Street, Detroit, Mich.

Did You Ever Keep a Record
Of Your Cows?

IF SO, you have felt the need of a convenient, simple and handy Record Sheet. We have had so many requests for these Record Sheets that we concluded to get up one that would "fill the long felt want." We have a very simple and complete Record Sheet for 10 cows, one month, that is printed on heavy Manilla Paper, we can send postpaid at following prices:

Price 5c Each	6 for 20c	12 for 30c	25 for 50c

SIZE 10x16 INCHES

We also have a one cow Record Sheet, heavy Manilla paper (one month) that we will mail postpaid

Single Copy 5c	5 for 15c	10 for 25c	25 for 40c

SIZE 6x15 INCHES

HOARD'S DAIRYMAN.
FORT ATKINSON, WIS.

he termed butter, and which he claimed was better flavored than the best creamery or dairy butter made by anyone. I questioned him somewhat about the composition of the butter he would make in this way and he stated he did not know what it would contain, but he did know that the amount of butter made would be increased seventy-five per cent and that the product would be far superior in quality to that of the butter he started with.

Taking his statements as given, which were that three-fourths of a pint of milk is added to every pound of butter and that the butter is increased seventy-five per cent, we can readily see what happens in his process of making butter. Three-fourths of a pint of milk will contain at least one-half pint of water and according to his figures he is thus adding half a pound of water to every pound of butter. This would be a paying investment if one could sell the water for butter prices, but I reminded the agent that legal butter in the United States must not contain over sixteen per cent of water, and the product he makes will, therefore, not be legal butter.

This attempt to increase the weight of butter by mixing water with it is an old one, but it crops out every once in a while under some new name, Parties who may be approached by such an agent as this should look into the matter thoroughly before investing in a secret process, the use of which, the agent claims to be able to teach anyone who is able to to pay for it. Of Interest to Farmers.

Conserving a Water Supply—A Novel Method for Heating Water for Stock.

ED. HOARD'S DAIRYMAN:—Among the arrangements for saving and making the most of a limited water supply, Mr. F. W. Draper, of Enosburg Falls, Vt., who has a farm in the adjoining town of Sheldon, has devised a method that is somewhat novel in character, yet practical and successful. On the farm there is a large cattle barn and also a horse barn for which a supply of water has to be provided, besides the house.

At some distance from the buildings there is a spring that furnishes rather a small but uniform supply of water during the year. The amount is sufficient for house and barns the year round by being carefully husbanded.

There is not a sufficient down grade from the spring to the house to allow of the water being conducted to the first floor, so a large cistern of stone 24x8x4 feet in dimensions is built in a portion of the cellar, into which the water will run. From this it can be pumped to the floor above and will run to the barn or yard in one direction, and to the horse barn in another. It is so arranged that the water can be drawn as wanted for use and then stopped. In this way there is the needed supply and the arrangement which has been in use for a considerable number of years continues to work most successfully.

There has been no trouble from freezing as yet, as the large amount of water in the reservoir is kept at an even temperature. This is the first arrangement of the kind the writer has ever known, and it is possible that its successful operation may be an inducement to others, similarly situated, to put into use on their premises. As will be seen, the method is adapted particularly to a limited supply of water, and on land on which there is not much descent or head.

As to the method for heating water for stock, the writer saw this arrangement several years since on the farm of Mr. C. F. Smith, of Morrisville, Vt., a live-go-ahead agriculturalist, who has an eye to utility and practical results.

He had plenty of good spring water and at one time had it running in the stables before the cows, but not being satisfied that this was a suitable arrangement for the cows, of which he had a fine Jersey herd, he removed it from the stable to a commodious yard adjoining. But as the water was then considered too cold for the cows, he contrived a novel method for warming it.

He had a furnace in the cellar for warming the house, and as the water from the spring could be conducted so as to run in a pipe through the upper part of the furnace, there was no difficulty in the matter. The part of the pipe that passed through the furnace was made into a coil so as to retain the water longer while passing through, thus heating it sufficiently for the purpose. With this arrangement, there was warm water in the yard from the time the fire was started in the furnace in autumn until it was no longer needed, and with no extra cost for heating. This was also something new to the writer, and possibly there are those who with similar conditions might be equally benefited by some such arrangement, which would certainly be worthy of careful consideration, and in the interest of such, this somewhat novel arrangement is given. E. R. TOWLE.

Franklin Co., Vt.

Mr. Clawson's Method of Handling Clover Silage.

ED. HOARD'S DAIRYMAN:—In response to the request of the senior editor we gladly say we have no trouble taking out our clover silage even though it is long, but we anticipated trouble, and had to learn by experience. We take great care in filling our silos that the fork drops its load near center of silo which is 11x11x27 inside and round cornered, the forkfull always finds the center of silo. If the drop is far and the doors kept closed, four of us worked in the silo while unloading and no danger if we stepped in corner as the fork unloaded; the air rushes up, lifting the outsides up like an umbrella in a storm and makes it quite easy to spread evenly which is of vast importance. A forkful thus spread comes out in layers and is passed through our 2x2 foot windows easier than hay and more rapidly than corn silage. But you must take that which is on top and not dip too deep. P. CLAWSON.

Okeana, O.

Some Wisconsin Jersey Tests.

ED. HOARD'S DAIRYMAN:—We are officially testing a large number of our Jerseys for butter fat, the test being conducted the entire year by the experiment station. So far, eight cows have finished their year's work, which I give in butter fat, also carried out into butter by adding one sixth, the average butter of the eight being 524⅝ lbs. Following is the record:

cows.	*Lbs. butter fat.*	*Lbs. butter.*
Loa 107279	479.0	558
Loretta D. 141708	518 9	605
Belle R's Sister 2d 109932	412.5	481
Avileur 10884	390.0	455
Lady Meroe 152987	348.1	406
Edith's Faith 69724	464 7	542
Mabellena 107603	495.2	577
Miss Jepson 148651	491.7	573

The fith cow in the above list is a two-year-old heifer, making 406 lbs. with first calf. In comparing our own personal tests with the test of the experiment station's work there was but very little difference. Some months we were a little ahead and sometimes they were, but figuring up at the end of the year there was practically no difference.

It has been a great satisfaction to me to have this work done, as it practically corroborates the work we have been doing for a good many years. We have also kept an account of what they have eaten and what it has cost to keep each cow. For the entire year the most economical cow produced butter at 6¼ cents per pound. F. H. SCRIBNER.

Rosendale, Wis.

Special Prizes for Holstein-Friesians.

The Holstein-Friesian Association of America has empowered a special committee consisting of W. J. Gillett, Rosendale, Wis.; F. B. Fargo, Lake Mills, Wis.; M. E. Moore, Cameron, Mo.; W. B. Barney, Hampton, Ia.; H. B. Daggett, Lake Mills, Wis., and Robert W. MacGuire, St. Louis, with authority to act concerning the Association's special prizes on Holstein-Friesian cattle at the World's Fair. The committee has notified Chief Coburn that $1,472.50 has been set aside for this purpose, arranged with special attention to the encouragement of smaller breeders of Holstein-Friesian cattle to exhibit at St. Louis.

The regular prizes offered by the Louisiana Purchase Exposition to Holstein-Friesian exhibitors amount to $3,995 The World's Fair regular and special prizes for Holstein-Friesian cattle are about $1,000 more than double the offerings on the same breed at the World's Columbian Exposition in 1893.

There's just this about the EMPIRE CREAM SEPARATOR

WILL IT PAY YOU TO TAKE HOARD'S DAIRYMAN?

W. H. Jenkins took a census in 1901 of 50 farmers who were patrons of the creamery in Montrose, Pa. Twenty-five of themread dairy papers; twenty-five did not. The twenty-five who did read dairy papers averaged $50.23 per cow for the year. The twenty-five who did not read averaged $32.95. Here is a difference of $17.28 per cow. Did it pay the twenty-five to read? Did it pay the other twenty-five not to read? That's not all. Those who did read averaged a profit over cost of food of $15.06 per cow. Those who did not read averaged a profit of 66 cents. Is not that dairy farmer standing greatly in his own light who will not pay 2 cents a week for Hoard's Dairyman? These are hard facts worth thinking over.

A LESSON IN DAIRY ECONOMICS.

There is not a reader of Hoard's Dairyman that cannot profit from a diligent study of the admirable paper, published elsewhere in this issue, prepared and read by Prof. C. L. Beach, of Connecticut, before the Dairymen's Convention in New Hampshire, last winter. It supplements and confirms the various cow censuses which Hoard's Dairyman has had taken in various states, and those taken by the Wisconsin Dairymen's Association, and is in exact accord with Prof. Haecker's work and conclusions in Minnesota, and the experience of Mr. Gurler in his herd at DeKalb, Illinois, and Mr. Ellis, in Massachusetts.

It is a plain recital of plain facts as they developed and were recorded from day to day in the dairy herd at the Connecticut Experiment Station. There is no preconceived theory or personal opinion to be upheld or overthrown by suppression of some of the facts or juggling with the figures. It is such matter as Hoard's Dairyman is constantly in search of for the information and guidance of dairymen everywhere.

We call special attention to the fact that this Connecticut herd contained no cows that did not nominally belong to one or other of the specific dairy breeds, showing that dairymen should not place over much confidence in breed or breed names, but should rely more upon type or conformation, supplemented by a faithful record of performance. Only those cows are profitable which can show a profit, no matter what their breeding or name. Not every cow of even strictly dairy conformation will prove profitable at the pail, and not every cow of beefy conformation will prove unprofitable.

There are exceptions to all general rules, and the poor cows of dairy type, and the good cows of beef type, constitute exceptions to the general rule that profitable dairy cows have a distinctive dairy type.

THE ECONOMIC VALUE TO THE FARMER OF MACHINERY.

President Flanders, of the Farmer's National Congress, in his able address, at the late meettng of that body, gave a very interesting statement of the saving in the cost of producing certain crops, which has come through the use of labor saving machinery. The following are the figures he gives: He stated that the potential saving in the cost of human labor on account of improved implements, machines and processes, at the rate per bushel or ton, has been computed for seven of the principal crops for 1899 as follows:

In the case of the crop of corn, the money measure of the saving of human labor required to produce it in 1899, in the most available economic manner, as compared with its production in the old-time manner, was $523,276,642; of

Wheat	$79,194,867
Oats	52,866,200
Rye	1,408,950
Barley	7,323,430
White potatoes	7,366,820
Hay	10,034,868

The total potential saving in the cost of human labor for these seven crops of 1899 owing to the possible utilization of the implements, machines, and methods of the present time, in place of the old time manner of production, reaches the stupendous amonnt of $681,471,827 for this one year.

Now it would be equally interesting if some man could possibly compute the loss that comes to the farmers each year from the bad care of their machinery. A few years ago we built two large sheds for the storing of the vehicles and machinery on our farm. These sheds cost about $200, the interest and deterioration of which we place at 8 per cent per annum or $16.00. In those sheds are stored fifteen hundred dollars worth of tools, vehicles and machines. The loss in depreciation of this capital, if left exposed to sun and weather, from this cause alone, saying nothing of wear, is estimated by manufacturers to be fully 20 per cent. With good shelter this loss is obviated. Yet there are scores of farmers that we know, who struggle hard every year to get a little surplus to lend on note and mortgage, at five or six per cent, who will not lay out $100 to build a machinery shed that would pay 20 per cent interest on a thousand dollars' worth of valuable machinery. There is an old saying that some people lose more at the spigot of a barrel than others can put in at the bung. As farmers, we have not yet begun to study the economic science of our own business.

SUCCULENT FEED AND MILK FEVER.

Dr. Pearson, the noted veterinarian of the Philadelphia Veterinary College, in a lecture in 1894, spoke somewhat at length of the danger of giving too much grain feed to cows when dry. He said it caused trouble at the time of calving and that succulent food put the cow's system in the best possible condition for the dangers of that period.

Next to grass, there is no form of succulent food that approaches it in effect on the system like corn ensilage or roots. It would be a most interesting and valuable addition to the sum of our knowledge on that particular point, if the 40,000 readers of Hoard's Dairyman would put on their thinking cap and see if their experience bears out the doctor's statement. It looks reasonable from a physiological standpoint.

Now, suppose our readers drop us a postal card stating in brief as follows:

Have been dairying for — years. Have lost — cows with milk fever before putting in a silo. Then state whether they can see any improvement in this respect since they commenced feeding ensilage.

What we are after is to get a concensus of opinion on this one proposition:

Does the feeding of succulent feed in the form of ensilage lessen the percentage of attacks of milk fever?

Do those who have silos show any better record in this respect than those who do not?

Send us your experience.

CERTAIN DAIRY PROPOSITIONS.

This is a very wide country, with many variations of soil, climate and gradations of dairy intelligence in the farmers who keep cows. All these things modify results to a certain degree. They also increase or decrease profits as the case may be. There are many ways of doing the same thing. Creamery practice in New England, or New York, or Wisconsin, is not the same as it is in Kansas.

In the latter state there has sprung up a system based on the following methods: A large company, with abundant capital, enters a given territory with the farm separator. They make arrangements with the railroads and express lines for the shipment of cream to them at some central point. Their agents set to work and canvass the territory for 10 to 15 miles, say on each side of the railroad and for 300 miles in length, and induce the farmers to buy separators and send them the cream, retaining the skim milk on the farm. This system does away with the ordinary creamery entirely. The farmer brings his cream to the railroad station just as he would his wheat, oats, or potatoes. The company settles with the patrons once a month and pays for the cream on the following basis, which we copy from the circular of the J. P. Baden Produce Co., of Winfield, Kansas, which town is the center for nine railroads.

The company binds themselves to buy the cream for five years giving the patron privilege of stopping any time, and at the scale of prices named below. They buy the cream on its butter fat content as shown by the Babcock test, the price to be governed by the average quotation for the month of extra separator creamery butter in New York, the company paying all express charges and return the cans free of charge. The following are the prices.

Within 150 miles of Winfield 2½ cents less than New York.
From 150 to 200 miles of Winfield 3 cents less than New York.
From 200 to 250 miles of Winfield 3½ cents less than New York.
From 250 to 300 miles of Winfield 4 cents less than New York.

Concerning this method of doing business the company have the following to say:

"A cow that will give a gallon of milk (8 60-100 pounds) at a milking or (17 and one-fifth pounds daily) yields 500 lbs a month. At an average test of 3.8 per cent she will earn from $3.23 to $4.56 per month on the basis of the prices paid for butter fat in 1900. The feed that will produce a pound of dressed beef will make one pound of 20-cent butter fat.

That the most practical and economical way for the dairyman, is to separate his milk on the farm as soon as he is through milking.

That it is costing the price of one cow every year to haul the milk of five cows to the station, (and we suppose they mean the creamery as well).

That a centrifugal cream separator will more than pay for itself every year if one has but three to five cows.

That you cannot afford to feed sixteen to twenty cent butter fat to a four or five cent calf when there is an abundance of cheaper feed to raise him on.

That when you feed a steer until he is three years old he is worth from $50 to $60.

That he goes to market and takes your corn with him leaving you nothing.

That you can milk that much money out of a good cow in one year and still have the cow left."

The company farther says that the cost of keeping a cow in Kansas is as follows: Feed, $20; labor to milk and care for her, $10; interest, $2.50; total cost of keeping $32.50, which is a third less than in the states east of the Mississippi. They reckon that it will require 115 pounds of butter fat and the skim milk to pay the cost of keeping a cow a year in Kansas. The foregoing proposition may prove interesting reading to many who survey the dairy business from a different environment and standpoint.

THE HIRED HELP QUESTION.

All over the land is heard the complaint among farmers, that they cannot obtain the help they desire. We hear of no such complaint among manufacturers. A brief study of the methods pursued by the manufacturers to secure labor, as compared with farmers, convinces us that new ideas and plans must prevail among those needing help on farms.

(1) There must be a disposition to consider the help question as one of the important questions of the farm. At present not one farmer makes any special effort to secure help. We are told by men connected with employment agencies in cities that there are thousands of foreigners there who were bred and trained to work on farms in the old country and who, if they could get a good home to live in, with a bit of land to cultivate and the milk of a cow for the children, together with their fuel, would much prefer life on a farm to their present unsatisfactory mode of living.

But there they are in the city. They know nothing of the country and the farmer makes no special effort to know anything about them. Between the two there lies a no-man's-land. Now the manufacturer acts differently. When he wants help he consults some man or agency that makes it a business to supply labor, and for a small consideration he furnishes the men. It is a regular, legitimate business. Why should not the farmer re-organize his ideas and take advantage of conditions, the same as the manufacturers? Has he ever tried it? It may be, but if so, we have heard of it only in a few instances. Then again, farmers with large herds of cows must make some special concession to their help. It is not a very serious sacrifice to knock off labor in the field at half past four o'clock say, and go at the work of milking and caring for the pigs and cows. They will have altogether better milking, better pigs and calves if this is done and they will get their pay for it in the end.

Then again, comfortable tenant houses and lots more of them should be built. If it is true that there are many married men in cities who would prefer farm life with such comforts, farmers ought to know something about it. Have any of our readers any knowledge born of experience to offer on this question? Let us have a discussion of the help question.

THE KEY NOTE.

The key note to profitable dairy farming is to be found in a close study and mastery of economic effort or labor.

We do not believe there is a business on earth where there is as much waste of labor, time and money as is found on the average dairy farms of the country.

There is the waste of poor cows; the waste of unscientific feeding; pouring costly food unsuitable to the purpose of economic milk making into the cows; the waste of unhealthy food and disease breeding stables; the waste of poor methods of soil culture, and its consequent waste of fertility; the waste of poor care of young animals in the first

year of their lives whereby they are not worth half as much in the market as they should be, and finally the great waste of brain and thought, or rather the waste that comes from a lack of brain and thought. Such a host of men there are who prefer to be ignorant of what it means to be a good, economical farmer. Who are as contented as can be in having no hunger or thirst for the knowledge that shall build them up and make first-class men and farmers of them. From one end to the other of it, successful dairy farming calls for a man who has so much pride in the mastery of his business, in his possession of important ideas and methods, as have the best professional men in the country. Such a dairy farmer will be ashamed to be found ignorant, or have his sons ignorant, of what science is doing for him. Such men are the ones who show the largest profits and who win, besides, honor and fame among men.

Oleo in Wisconsin.

ED. HOARD'S DAIRYMAN:—The following circular letter has been issued by the commission:

TO DEALERS IN OLEOMARGARINE IN WISCONSIN:—Your attention is hereby called to the Wisconsin state law relative to the sale of oleomargarine, butterine, etc., a copy of which law is herewith enclosed. Your attention is particularly called to the fact that the sale of oleomargarine "which shall be in imitation of yellow butter" is prohibited in this state. The penalty for the first offense is not less than fifty dollars nor more than five hundred dollars, and for each subsequent offense imprisonment in the county jail not to exceed sixty days nor less than ten days, or a fine of not more than five hundred dollars, nor less than one hundred dollars, or both such fine and imprisonment. Every available force of this Commission will be used to enforce this law strictly.

The sale of oleomargarine in a separate and distinct form and in such a manner as will advise the consumer of its real character, and "free from coloration or ingredient that causes it to look like butter" is lawful in this state, provided the regulations of such law prescribed by the state legislature are strictly complied with. See Section 4607d, Wisconsin statutes of 1898.

The above mentioned laws are the laws of the State of Wisconsin which govern the sale of oleomargarine in this state, and are a copy of the Massachusetts Oleomargarine law, concerning which the United States Supreme Court in Plumley vs. Mass., 155 U. S., 461 says: "The statute seeks to suppress false pretenses and to promote fair dealing in the sale of an article of food. It compels the sale of oleomargarine for what it really is, by preventing its sale for what it is not."

Certain advertisements of butterine have recently been circulated in this state, claiming that it has a rich, creamy shade, and by soliciting dealers to handle the same, thereby seek to delude them into a violation of the state law. Butterine cannot comply with Wisconsin law in being "free from coloration or ingredient that causes it to look like butter" and at the same time have a rich, creamy shade. If oleomargarine or butterine has a rich creamy shade, it thereby carries its own self-condemnation as not complying with the terms of the law in this state.

Certain manufacturers of oleomargarine and their agents when conducting their business with dealers and when corresponding with this commission assume an innocent ignorance of the provisions of Wisconsin statutes and blandly plead that their products comply with the provisions of the United States laws and the rulings thereon by the United States Commissioner of Internal Revenue. Their dissembling course in this respect, in undertaking to induce dealers to violate the law of their own state, furnishes an extreme exhibition of impudent effrontry to the intelligence and law abiding spirit of Wisconsin dealers. The efforts of such agents and manufacturers to ignore the unmistakable provisions of the Wisconsin law and to delude dealers into the belief that the sale is lawful in Wisconsin of oleomargarine which shall be in imitation of yellow butter and not free from coloration or ingredient that causes it to look like butter, must be regarded as disingenuous.

The United States Oleomargarine Law, approved May 9th, 1902, under which all oleomargarine manufacturers and their agents must conduct their business, expressly provides: "That all articles known as oleomargarine, butterine, imitation, process, renovated or adulterated butter or imitation cheese, or any substance in the semblance of butter or cheese not the usual product of the dairy and not made exclusively of pure and unadulterated milk or cream, transported into any state or territory of the District of Columbia and remaining therein for use, consumption, sale or storage therein shall, upon the arrival within the limits of such state or territory or the District of Columbia, be subject to the operation and effect of the laws of such state or territory or the District of Columbia, enacted in the exercise of its police powers to the same extent and in the same manner as though such articles or substances had been produced in such state or territory or the District of Columbia, and shall not be exempt therefrom by reason of being introduced therein in original packages or otherwise."

Persons who sell in Wisconsin or solicit orders for oleomargarine or butterine which "shall be in imitation of yellow butter" and not "free from coloration or ingredients that causes it to look like butter" become violators of the law of the state and liable to legal prosecution.

Please take notice that unlike the United States law the term "artificial" in relation to color is not used and this one word "artificial" makes a vast difference between the United States and the state laws on this subject. To be lawfully salable under the laws of this state oleomargarine or butterine must be "free from coloration or ingredient that causes it to look like butter." Mark, the state law does not say free from "artificial" coloration or ingredient that causes it to look like butter. It matters not, under this statute, whether the coloration is due to "artificial" means or otherwise.

Being in imitation of yellow butter is what is unlawful in this state.

This circular letter is to inform dealers or would-be dealers in oleomargarine or butterine in this state as to the laws of the state that absolutely prohibit the sale in Wisconsin of oleomargarine or butterine "which shall be in imitation of yellow butter" and to caution them against being deluded by the agents of the manufacturers of oleomargarine, butterine, etc., into the belief that a United States license to sell so-called "uncolored" oleomargarine or butterine protects them against the operation of the Wisconsin state law. Such statements by whomsoever made are absolutely untrue. Agents of manufacturers who promise to defend violators of the law of this state in the courts would hardly be able to restore to dealers the reputation of being violators of the law, or free them from the odium of becoming criminals under the law.

The sale of oleomargarine which is "free from coloration or ingredient that causes it to look like butter" is lawful and legitimate in this state, and as oleomargarine of such description is upon the Wisconsin market and can be procured by dealers and at oleomargarine prices, there can be no warrant or excuse for dealing in an article whose sale is unlawful. It is believed that the dealers being correctly informed as to the true state of affairs, will limit their business transactions in oleomargarine, butterine, etc., to lawful products.

It is made the duty of the Wisconsin Dairy and Food Commissioner to enforce the dairy and food laws of the state and it is his purpose to enforce these laws to the fullest extent possible with the force at his command, instituting legal prosecutions if necessary.

J. Q. EMERY, Commissioner.

The One Minute Churn.

ED. HOARD'S DAIRYMAN:—I enclose a circular of a churn which is being introduced through this section. I suspect it is a fake; if not, it is a good thing. Please let us know though your valuable paper just what it is. The indorsements are from your section and dated 1900, so I presume you know something about it.

Jefferson, Ohio. A SUBSCRIBER.

The circular shows that the churn is one of the old-new inventions, gotten up to sell to dairymen. They have been tried many times and always with failure. They don't make one to ten per cent more butter, nor better butter, nor with less work. Nothing has ever been invented that will do better work than the old box or barrel churn, and, as a good churn of any kind will take all but 0.1 per cent of fat out of the cream, it is difficult to see any room for improvement. As to time, the one minute churns all injure the grain of the butter and that point always condemns them.

INQUIRIES AND ANSWERS.

Every inquiry must be signed with the name, Post-office and state of writer. Condense the questions into plain specific inquiry. Be careful to note if your questions have not been answered in replies to others. We are glad to answer all the pertinent questions that we can concerning machinery. Look over our advertising columns and write to the advertisers.

A Vermont Ration for Cows and Horses.

Will you kindly help me formulate a ration for my cows, grade Jerseys of about eight hundred pounds, three coming fresh this month and nine coming fresh in February, of the following feeds: Barley and pea hay, cut green; a limited amount of oat silage; will feed all hay for roughage when it is gone; would like to feed bran and cotton seed meal for grains as I have them on hand. Would you advise feeding any other grain with these? Corn, $23; bran, $20; cotton seed meal, $28; linseed meal, $28. Cows are not heavy milkers; will give from twenty to thirty pounds a day.

Please also prescribe a ration for my horses of about eleven hundred pounds, doing moderate work. We appreciate the good work the DAIRYMAN is doing and consider it a friend in need.

What amount of salt should be mixed with one-hundred pounds of grain for cows? H. S. W.

Passumpsic, Vermont.

As there are no analyses of barley and pea hay, or of oat silage, we cannot give a formula in tabular form. Such forage would be relatively high in protein, thus indicating that corn and bran would be a better combination of grain than bran and cotton seed meal. We should think that 4 lbs. of bran and 1 lb. of cotton seed meal, with what hay and silage each cow will eat without waste, ought to give good returns, but if these are not satisfactory we would increase the grain allowance with corn, adding a teaspoonfull of salt to each feeding of grain. It is doubtful if salt, in the limited amount required, could be evenly mixed with the grain in bulk, but if it could, two lbs. would be about the quantity we would try.

For horses, mix bran and corn, equal parts by weight, and feed about 8 lbs. of this mixture daily, with hay above mentioned.

For Canadian Ayrshires.

Please prescribe balanced ration for Canadian Ayrshire cows weighing about 1,000 lbs each, from the following feeds: Ground linseed oil cake costing $25 per ton; wheat bran, $17@$18; wheat shorts, $19@20; ground oats and barley, $20@$24; clover hay, also mixed timothy and clover grown on farm worth $8 per ton; ensilage corn cut part in milk and part in glazing stage on farm; oat straw for bedding and roughage saved in good order. SUBSCRIBER.

Montreal, Que.

At the prices given we should be disposed to encourage the cows to eat as much of the hay and silage as possible, the relative amounts of each to be governed by the supply on hand. If there are half as many tons of hay as silage, we would try the following combination.

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
30 lbs. silage	7.92	.39	4.20	.21
15 lbs. hay	12.79	.72	5.34	.24
4 lbs. bran	3.52	.50	1.54	.12
3 lbs. oats (or barley)	1.78	.18	.85	.08
1 lb. oil meal	.91	.29	.33	.07
Total	26.92	2.08	12 26	.72

Three Pennsylvania Questions.

I would like the opinion of some of HOARD'S DAIRYMAN readers in regard to using disk harrows or Cutaway harrows on stony ground.

Also, what is the best way to ventilate a cow stable in lean-to 18 by 80 on back side of barn?

Do you think ensilage shortens the number of years that cows are at their best? F. L. D.

E. Sharon, Pa.

The first of the above inquiries is, as requested, referred to our readers for answer; the second has been answered so many times recently, that it seems unnecessary to go over the ground again at the present time; and to the third we return an emphatic negative. Of course cows can be improperly fed on silage, as they can on any other feeds, but the rational use of silage is not only wholly unobjectionable, but is, in fact, beneficial to health, longevity and increased production.

An Impossible Overrun (Surplus).

Will you please give the method and tell how it is possible, for a creamery to get a 25 per cent surplus of butter over or above the butter fat test. According to the statement of a neighboring creamery, they have accomplished that feat.

Keene, N. H. J. J. D.

It is both a mechanical and mathematical impossibility to get a 25 per cent overrun, provided the resulting butter comes up to a commercial standing. The Dairy Division of the United States Department of Agriculture has ruled that butter to be of standard quality must contain not less than 82.5 per cent of fat. If there were absolutely no losses in creaming and churning, it would be possible to make 121 pounds of such butter from 100 pounds of fat in the milk, and the overrun or surplus would be 21 per cent. But there are inevitable losses, and, in the present state of the art of butter making, these cannot be brought below about 3 per cent of the total fat and will average much more than this. That is to say, given a quantity of milk containing 100 pounds of fat, the best the most skillful operator can do, with the best modern machinery, is to put 97 pounds of this fat into butter ready for market.

If this butter contains only the minimum of fat, 82.5 per cent, the yield will be 117.5 lbs., an overrun or surplus of 17.5 per cent. If the losses exceed 3 per cent of the total fat, as they usually will, or the butter contains more than 82.5 per cent fat, as butter frequently does, the overrun will be less. In fact, an overrun of 12.5 per cent may be considered fairly good work in any creamery where there are several patrons, delivering milk of varying quality, both as to condition and per cent of fat. The losses in creaming and churning are proportionally larger with 3 per cent milk than with 5 per cent milk.

Does Rape Injure Swine?

Early in spring I advised one of my neighbors to sow rape for hog pasture, which he did, purchasing the seed at the elevator here. After it was large enough he turned his hogs in, and in a week all the hogs had sore noses, being all raw. After a few days, scabs formed and were so sore that the pigs fairly squealed if they touched anything with their snouts, Can you give me any reason why that was and how to prevent it, as I want to sow a rape pasture next spring, if I can be sure not to have the same trouble. W. N

Cecil, Wis.

As there is no one in this country with more experience or better posted on all questions connected with rape than Prof. Henry, we referred the foregoing inquiry to him for answer. As will be seen, he confirms what we said some weeks ago, citing simply only our personal experience with rape the present season. Whatever else may cause the trouble complained of, it is reasonable certain it was not rape. Following is Prof. Henry's reply:

Twice before, if my memory serves me, similar complaints have come to the College of Agriculture. I doubt, however, if the cause assigned is the correct one. Thousands of farmers in the Northwest are allowing their pigs to run in rape fields without such troubles arising. Since this is the case, we should be very slow in condemning rape as a useful feed for hogs. Your correspondent is urged to keep on growing rape, and when the next season comes around to have a good patch and to again use it for pig feeding. Probably the trouble will not annoy. In order to help himself in the present case, let him follow the directions given below. They should prove helpful.

CANKER SORE MOUTH IN YOUNG PIGS.

[*Special Bulletin, Wisconsin Experiment Station, May 1901.*]

This disease is comparatively new in Wisconsin. Where it has appeared it has usually been exceedingly fatal. All farmers receiving this bulletin are urged to preserve it for ready reference should the trouble break out among their swine at some future time. The disease invariably appears in young pigs from the time of birth until six weeks old.

The symptoms are as follows: Large water blisters appear about the lips and snout, rapidly succeeded by much heat and swelling of the parts, and later thick brown scabs appear which open into deep cracks. These scabs extend over the face, head, and even to the body and limbs, the joints of the latter becoming much swollen and inflamed. Ulcers frequently form about the snout and jaws, eating the flesh from the bones. The pigs show dullness, a disinclination to move, often refuse to suckle or do so in a very half-hearted manner.

To be effective, the treatment should be prompt and thorough. Prepare a solution of permanganate of potash, which can be had at any drug-store, using one ounce of the crystals dissolved in one gallon of water in a common pail. The young pigs should be dipped head foremost into the solution and kept there for a brief time. Repeat this two or three times, giving the pig time to catch its breath in the intermissions. This treatment given every day for three or four days, will usually effect a cure if the trouble is not of long standing. In extreme cases where ulcers and heavy scabs have formed, use two ounces of the permanganate to one gallon of water, and before dipping remove all the dead and loose tissue that has been eaten away. The sow's udder should be bathed freely with the solution each day.

Remove the sow and pigs to fresh quarters if possible, and see to it that other successive litters are not farrowed in the pen where the affected pigs were housed until it has been thoroughly disinfected. Benefit will also be derived from a laxative given the sow; a pint of raw linseed oil in her slop or in milk will be suitable.

Ventilating a Stable.

Please tell me how to ventilate my cow stable for thirty-nve head of cows. The stable is 90x22 ft and 7 ft. high on the sides, no mow overhead, but a good tight roof, plenty of windows on the south side. The cows stand in two rows facing the sides with shallow gutters behind them; no feed alleys. Each cow has a stall to herself. The cows are out doors most every day in winter, as our days are nice and bright and the yard well protected.
Valentine, Neb. M. D. C.

Without a personal inspection of the premises or a drawing giving all particulars, it is impossible to give specific suggestions Successful ventilation depends upon the introduction of fresh air and the removal of the foul air. The latter is accomplished by building a flue, or flues, wherever they will be least in the way, with an opening at the bottom, very much after the pattern of the old fashioned fireplace and chimney. These flues can be built on the outside just as chimneys are often constructed, but they should be practically air tight from top to bottom. Windows should not be relied upon for supplying the necessary fresh air. A good deal will come in, sometimes enough, through the minute openings around doors and windows, and elsewhere, but there should be some intake flues, built as shown on page 773.

A Nebraska Ration.

Please compound a ration for me from the following feeds for thirty head of cows; about half of them fresh this fall: Bran, $14 a ton; shorts, $16; corn chop, $18. I have about 25 tons of sorghum hay, 15 tons of good millet hay and plenty of good prairie hay, the latter worth $6 per ton.
Valentine, Neb. M. D. C.

It would be very unwise to feed all cows the same amounts of hay and grain, even if they were all fresh this fall, because some of them will yield much more milk and better milk than others. In the very nature of things these differences in yield will be much greater where only a part of them have recently freshened. A cow should be fed in proportion to her ability at the time to respond to feed. Feed is the raw material out of which the cow manufactures milk. The greater the yield of milk the more feed will be required. For the fresh cows an average daily allowance would be about 5 lbs. each sorghum and millet hay, 10 lbs. prairie hay and 8 lbs. bran. If the feed called shorts is true to name and not mostly reground bran, we should deem it advisable to substitute 4 lbs. of this for 4 lbs. of bran.

Ayrshires at the St. Louis Fair.

Chief Coburn of the Live Stock Department of the World's Fair has advices from leading Ayrshire breeders of an intention to enter that breed in the World's Fair cow demonstration. The Ayrshire men at the Illinois State Fair held a meeting and passed resolutions requesting the Ayrshire Breeders' Association to take early action toward inviting breeders to furnish cows for the demonstration. The resolutions were signed by W. P. Schenck, Avon, N. Y., as president, and G. H. Converse, Woodville, N. Y., secretary of the meeting, and the following committee: Howard Cook, Beloit, Ohio; McCormick & Edgely, Pataskala, Ohio; and Secretary, C. M. Winslow, of the Ayrshire Breeders' Association. The breeders present pledged their services and cattle toward making Ayrshire participation a success at St. Louis.

The Ayrshire Breeders' Association has already made an appropriation of $2,000 in aid of the World's Fair Ayrshire exhibit.

Dairy Questions Answered by Prof. Farrington.

DETECTING WATERED MILK.

In receiving milk here I am often bothered with the addition of skim milk in small quantities, but not enough to bring the test down below a reasonable limit. For instance, I catch a man's test 3 9; lactometer, 1.031; and again at 3.9; lactometer reading 1,034, Of course figuring 3.9 against 3.6, I can judge reasonably the amount of skim milk added, but what I want is a simple formula showing by means of the lactometer, the probable amount of skim milk added when the reading is normal, and the amount of water added when the lactometer reading is not normal; that is, I want to get this information without stopping to make a Babcock test. F. J. C.
Tacoma, Wash.

I do not think it is possible for you to accurately judge regarding the amount of water which may have been added to milk without making a Babcock test of the milk. The use of the lactometer is a very simple and easy matter, as all that is necessary for you to do is to place this instrument in a small cylinder of milk, and read the point to which it sinks in the milk. This simple test, however, will not give you accurate information in regard to the skimming or watering of milk. It will always be necessary for you to make this lactometer reading, and a Babcock test in connection with it.

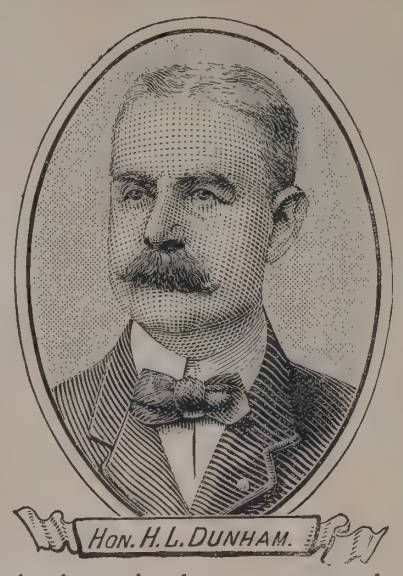
When you have the results obtained with both these instruments you can calculate the amount of solids-not-fat in each sample. From your knowledge then of the solids-not-fat and the Babcock test which shows the fat, you will be able to determine whether or not each sample is above or below the standard for these ingredients in your locality.

In some places all milk which tests less than 3.0 per cent fat is called "illegal" milk. In certain states and cities the standard of milk varies from 8.0 to 9.5 per cent solids-not-fat and from 3.0 to 3.7 per cent fat.

The skimming or the watering of milk to bring it below the legal standard, may be detected by determining the per cent of fat and the lactometer reading of a sample, and then by comparing these results with the local regulations regarding the standard of pure milk in your city. It is always well when you have a suspicion of a sample of milk to compare the test of it with other tests made of a "control' sample; that is, go to the farm where the milk is produced and see the sample taken from the herd, then compare tests of this "control" sample with those you have made from the same milk at other places.

This subject of milk adulteration and the method of determining to what extent the sample has been either skimmed or watered, is discussed in detail in the book, "Testing Milk and Its Products," which may be had by sending $1.00 to this paper.

TESTS WHICH GAVE NO FAT.



"I am doing the testing of milk in our cheese factory for the patrons and the last time I tested I had two bottles on which there did not come any butter fat in the neck of the bottles. In one bottle there was some kind of a gray scum on the top and on the other a kind of black sliminess, The milk was all treated alike as to the acid and other manipulations of the test. We repeated the tests from the two farmers a second time, treating the milk the same way as before except that we did not warm it before taking the samples. The butter fat in this case separated nice and clear. I would like to know why we did not get a test the first time. The only difference I noticed between the tests was that the first time we added the acid the milk turned black at once, and I think this was because the milk was sour. Can you explain this difference in testing to me?" C. E.
Forest Junction Wis.

I have never before heard of tests of normal milk which did not give any butter fat in the neck of the bottles when the test was properly made. The grayish scum you mention noticing on the top of the liquid in the bottle may have been due to a dirty test bottle or dirty water which you used in filling the test bottle. It certainly could not come from the milk.

The black, slimy deposit which was noticed in the other test bottle, suggests that you may have used too much or too strong an acid in making the test. When too much or too strong acid is used, or the acid or milk is very warm, the action of the acid on the butter fat is so strong that the fat is somewhat burnt. I presume you may have noticed the black spot which strong acid will make when some of it drops on a piece of soft wood, or when a match is placed in the acid, the wood turns black. This same action of the acid on the fat in milk will take place if the acid is either too strong or too warm.

Another thing that sometimes interferes with the proper separation of the fat from the acid mixture is the imperfect mixing of the milk and acid in the test bottles. The acid ought to be added to the milk in such a way that it follows the inside walls of the bottle to the bottom and makes a clean line of separation between the acid and the milk. When the acid is carefully added in this way the bottle may be allowed to stand sometime before mixing the milk and acid, but if through any accident in pouring the acid into the milk it passes through the milk and leaves black colored streaks through the milk or between it and the acid, a clear separation of the fat can only be obtained by shaking the bottle and doing the mixing at once. This mixing of the milk and acid is a very important point to be attended to in milk testing, and if the test bottles are allowed to stand after only partially mixing the milk and acid, the test when completed will show a burnt fat in the neck of the test bottle. This is caused by the strong action of the acid on only a part of the milk before it has been diluted with the entire quantity of milk which has been added to the test

NATURE'S GREATEST AID

An interesting letter to our readers from Hon. H. L. Dunham, Ex-Mayor of Dover, N. J.

Dover, N. J., Nov. 12th, 1902.

I had both kidney and liver trouble for over three years. I tried the best physicians in Washington, D. C., Pittsburg, Cincinnati, and Chicago, and regret to say that I received very little benefit until I commenced taking the great kidney, liver and bladder remedy, Dr. Kilmer's Swamp-Root. After taking the first bottle I noticed quite a change which satisfied me that at last I had found the right medicine. I continued on until I had taken four bottles, by this time I noticed such a marked improvement in my health, in every way, that I felt satisfied I was cured. But, to be positive beyond a question or doubt, I was in Chicago during July, 1902, and went to the Columbus Medical Laboratory, No 103 State St., and had them make a thorough and complete microscopical examination which showed my kidneys and liver to be perfectly well and healthy. I have their written report in my possession, signed by the doctors of the above Medical Laboratory, which is recognized as one of the best in the country.

Very truly yours,
H. L. Dunham
Ex-Mayor of Dover, N. J.

The mild and prompt effect of Dr. Kilmer's Swamp-Root, the great kidney, liver and bladder remedy, is soon realized. It stands the highest for its wonderful cures of the most distressing cases. Recommended and taken by physicians, used in hospitals and endorsed by people of prominence everywhere. To prove what Swamp-Root will do for you a sample bottle will be sent absolutely free, by mail, also a book telling all about Swamp-Root and its wonderful cures. Address Dr. Kilmer & Co., Binghamton, N. Y., and be sure to mention reading this generous offer in the Fort Atkinson HOARD'S DAIRYMAN.

If you are already convinced that Swamp-Root is what you need, you can purchase the regular fifty-cent and one-dollar size bottles at the drug stores everywhere. Don't make any mistake, but remember the name, Swamp-Root, Dr. Kilmer's Swamp-Root, and the address, Binghamton, N. Y., on every bottle.

KEEP HOARD'S DAIRYMAN IN A FILE.

It preserves each copy and keeps them handy for reading and reference. We buy these binders in large lots and sell them to our readers for just what they cost us. We want you to have them. We will send a heavy Manilla Binder with cloth back, postpaid, for 30c, or will send for one new subscription (not your own.) We will send a strong, handsome Binder, very serviceable, postpaid, 60c, or will send for two subscriptions (your own subscription and one new one will obtain this.)

bottle. By using a little care in adding the acid to the test bottle and by mixing the milk and acid thoroughly at one time, you will have no difficulty in getting a clear separation of the fat, provided the acid is of normal strength, and either the milk or the acid are not above 70 degrees F. when the mixing is done.

The sourness of the milk had probably nothing to do with the blackness of the fat which separated, unless it caused a partial mixture of the milk and acid when you added the acid to the milk in the test bottle.

LONG CHURNINGS.

"By request of one of my neighbors, a well-to do farmer, I am asking the following question: What is the cause of his having to churn from two to three hours before obtaining butter?"
Horns Corners, Wis. H. S. S.

The normal time of churning recommended by good authorities is about three-fourths of an hour. If the butter does not come after two or three hours churning the cause of the delay is usually one or both of two things: First the temperature of the cream is too cold and the room in which the churning is done is also so cold that the cream does not warm up to a churning temperature. Second, cream that is obtained from the milk of cows late in the period of lactation, or stripper cows, is also extremely viscous that it is very hard to churn it, and even warming the cream to a churning temperature, or the adding of hot water, or brine, will not cause such cream to churn.

The temperature at which a long churning occurs, is usually in the neighborhood of 50° F. A thin cream containing 15 to 20 per cent fat will churn indefinitely without making butter, if its temperature is held down to 50° or lower. It is only possible to churn cream at this low temperature when it contains at least 35 per cent fat. In such cases the churning may be done in a very satisfactory way and the texture and body of the butter obtained are excellent. Ordinary farm cream, however, is not often so rich as this, but it usually contains somewhere near 20 per cent fat, and in order to get good results in churning such cream, it is best to have the temperature of the cream near 60°F. and do the churning in a room where the temperature will not vary much from this point.

The best way to overcome the second difficulty mentioned, is to mix the cream from fresh cows with that of cows which have been in milk a long time. When this is done and a rich cream is skimmed from the milk, the difficulty of long churning may be readily overcome.

The two things to be kept in mind, therefore, are, first, to do the churning at a temperature appropriate to the richness of the cream. That is to say, if it tests near 20 per cent fat do not attempt to churn below 60°; if it tests 35 or more per cent, churn at a temperature near 50°.

Second, try to arrange the herd whose cream is being churned so that a majority of the cows will not be late in their lactation period at one time. If fresh cows are continually coming into the herd, and ensilage or some green feed is given them during the winter, I think you will have no difficulty in churning your cream in a reasonable time.

AN ESTIMATE OF BUTTER MAKING SUPPLIES.

"Will you please answer the following questions:
What is the average amount of salt required per hundred pounds of butter and the cost of same?
What is the average amount of butter color per hundred pounds butter and its cost?
What is the cost of different sizes of butter tubs and what size is mostly used?
What advantage is gained in packing butter in one pound prints?
Do some creameries receive more than the Elgin price for their butter? If so, how can I work up such a rade? I have been told that some factories get as much as eight and ten cents above Elgin for their product. Is this true. E. G. K.
Mt. Morris, Wis.

The amount of salt ordinarily recommended to use in butter is one ounce to the pound and for 100 pounds of butter you would, therefore, need to use 100 ounces of salt. The amount of salt left in butter, however, will vary with the dryness of the granular butter when the salt is added and the amount of working which the butter afterwards receives. If the granules are very moist a great deal of the salt will be washed away during the working, and of course the longer the butter is worked the more brine there is squeezed out of it and the fresher the butter becomes, so that the saltiness of the final product is largely influenced by the way in which the butter is made. You can, however, guage the amount to be added by the trade which you supply. Some customers like butter very salt, and others want it very fresh. If you sell on a general market, one ounce to the pound is a good rule to follow until you find out that your customers wish some change to be made in this quality of the butter.

Butter salt costs all the way from three-fourths of a cent to one cent per pound. Assuming that the average cost is 8-10 cents per pound, the cost of the salt for 100 pounds of butter will be near 50 cents.

The amount of color to be used in butter will necessarily vary during the different seasons of the year and somewhat according to the dry feed which cows receive in winter, as well as the natural characteristic of the cows to color their butter fat. As a rule, June butter is naturally more highly colored than that made in the winter, but on the other hand, clover hay when fed in the winter time has a tendency to increase the yellow color of the butter made from the milk of cows which are fed large quantities of clover hay. Again, it is a natural characteristic of the Guernsey cows to produce a more highly colored butter fat than that of the majority of cows of other breeds. You will see, therefore, that a standard rule for color cannot be given and followed during the entire year, because natural conditions vary the color of the butter fat in milk, and on the other hand the demand of the different markets is not uniform in regard to color. Generally, butter which is sold in the south should be more highly colored than that which goes to eastern and northern markets.

A simple calculation, however, will give you some idea of the cost of color per hundred pounds of fat. The average amount of color used is about one ounce of color to 150 pounds of butter. We can now buy five gallons of butter color for $8.50. This is $1.70 per gallon or 1⅓ cents per ounce. Hence you can calculate that the amount of color used per hundred pounds of fat will cost about one cent.

Butter is usually sold in sixty pound, five-hoop, ash tubs. These are now very high priced and at the present time you will probably have to pay about 28 cents per tub. This you will see is nearly one-half cent per pound of butter. These sixty pound tubs in the past cost from 18 to 22 cents. The unusually high price just now is caused by the scarcity of the wood used in making these tubs.

The popularity of butter in one pound prints seems to be steadily growing in the west. Print butter has been very common in the eastern markets for a good many years, in Philadelphia especially print butter has been in lively demand. I think you can sell as many pounds of butter by moulding it into one pound prints soon after it is made, as you can by packing the same butter into sixty pound tubs. There is always more or less shrinkage in the weight of tub butter because of the brine which will necessarily leak out of it between the time the butter is packed and sold. This loss in weight is entirely evaded if the butter is printed and each print wrapped in parchment paper. The printing of butter, of course, requires more labor, not only in cutting it up but in wrapping each print with the parchment wrapper, than packing in tubs. I think, however, that manufacturers and dealers in butter are coming to believe that the making of butter into one pound prints is more economical than packing it into sixty pound tubs.

These one pound prints are usually packed in boxes of various sizes holding from 10 to 50 or more pounds each. If wood is cheap in your neighborhood, you probably can manufacture these boxes, but it will be necessary that you use a wood which will not transfer its flavor to the butter during shipment. It is impossssble for me to give you any figures on this point. You will have to get them yourself from the local conditions and the price at which you can have supplies delivered to you at the town where the creamery is located.

I think it is a fact that some creameries receive more than the Elgin market price for their butter. This, however, is the exception, but if the factory will continually make butter that scores over 95 points and the product is uniform in quality and quantity, I think you will have no difficulty in getting a slight advance over the Elgin price for your butter. I have never heard of anyone receiving so much as eight to ten cents above the Elgin market price for creamery butter where it is made from the milk delivered by a number of different farmers, as is usually the case in our western creameries.

GOODBYE, WHEELBARROW

Every farmer who gets a Drew Elevated Carrier has no more use for the barnyard wheelbarrow. The **DREW ELEVATED CARRIER** will carry the manure from the stables to any point in the barnyard, drop it, return automatically, ready for another load.

It is self operating—it turns curves and switches—dumps its load in yard or wagon. Besides carrying manure you can use it to convey ensilage, feed, grain, potatoes, cans of milk, from one point to another. It works so simple and easy that any man or boy can run it.

THE DREW ELEVATED CARRIER

carries labor off from the farm—it is the farmer's labor and money saver. No trouble to put them up—no trouble after they are up.

It leaves barnyard free from posts—keeps the barnyard clean and free from litter. Get one and

The Distribution of Skim Milk.

It is known that the just complaints of creamery patrons on account of unfair distribution of skim milk are the bane of the separator creamery business. Further disputes among patrons, annoyances to managers, hindrances to the best work of buttermakers, watering the skim milk, and many other ills in the same train are unnecessary, since the

Barber-Coleman Check Pump

has for more than five years been successfully solving the problem in many different creameries. When a patron has dropped in his check he can pump the amount of skim milk called for by his check, less the percentage taken out as cream, so in like proportion to all other checks. Its measuring apparatus is just an ordinary pump which everyone understands and knows how to operate.

Market Reports Indicted.

A circular recently issued by the Minnesota Dairy and Food Commissioner contains the following paragraph:

"Many of our best creameries are receiving from one to one and a half cent premium for their butter, while others receive the usual half cent above. The latter are unable to secure this high premium because of the fact that their butter is of defective quality. This additional premium of one-half to one cent for the average creamery means an additional income of from $500 to $1,000 a year, a sum sufficient in many cases to pay the buttermaker's salary."

Commissioner McConnell very properly uses these facts as a text from which to appeal to the dairy farmers of Minnesota to take more pains to deliver milk and cream which shall be free from taints and all objectionable odors, because it is only from such milk and cream that even the best buttermakers can make butter of a quality commanding the largest premiums. In other words, it is only by intelligent and friendly co-operation between good buttermakers and good patrons that the best results can be obtained, and, it goes without saying, only the best returns should be satisfactory to either buttermakers or patrons

And it should not be forgotten, by either patrons or buttermakers, that "a chain is no stronger than its weakest link." As a careless buttermaker or his helper may neutralize the best efforts of his patrons, and make inferior butter from perfect milk and cream, by letting a vat or churn, or connecting pipe, pumps gate or valve become foul and tainted, so a single careless or indifferent patron, by delivering milk in bad condition, no matter from what cause, may set at naught all the care and efforts of other patrons to work together for the common good, to wit, the highest obtainable price for the combined product of their respective herds.

It follows that there should be a combined, co-operative and inflexible determination on the part of buttermakers and patrons, peremptorily to reject every offering of milk or cream, no matter by whom made, that will tend in any degree to lower the quality of the resulting butter.

It also follows, and this is the point we want to emphasize at this time, that markets and market reports need to be reformed. The air is full of "graft" and "rumors of graft," by officials of every degree, in national, state and municipal governments, and the facts stated by Commissioner McConnell, unmistakably indicate that the buyers and sellers of butter, in the price making markets of the country, are busily engaged in methods which make "graft" easily possible and therefore probable. If there are any Minnesota or Wisconsin creameries whose butter sells any week for, say, 22 cents, when the great bulk sells at 21 cents, or less, then in common honesty, such sales should be recorded and reported. If some dairy butter sells for more than the best creamery, as it in fact does, in every market, that fact, instead of being carefully suppressed, should be given the widest publicity as an incentive to other private dairymen. If the common run of Minnesota creamery butter sells for a half cent above current quotations, as Commissioner McConnell says is usual, what is it but a falsehood, to report the market price a half cent below what this Minnesota butter sells for? Do not such reports lay a foundation for graft?

Where to Buy Land.

ED. HOARD'S DAIRYMAN:—You have had no closer reader of HOARD'S DAIRYMAN for at least six years, than myself, and I can not understand how a man can have a sincere desire to succeed with his cows and with the general work on a dairy farm and not be a reader of the DAIRYMAN. When I went to work as a dairy hand six years ago, my employer said that the best thing I could do would be to subscribe for HOARD'S DAIRYMAN, and ever since, I have felt thankful to him for his advice. I have asked you for your opinion on matters of interest to me several times, and you have been so good and frank that I begin to look upon you as my main guide.

I am going to buy a farm and have about five hundred dollars saved up. I can not buy a farm here, such as I want, without more accomodation than anyone can safely allow, looking at the proposition from the other side, and I really incline towards some of the cheap lands that are advertised in the DAIRYMAN. I have to-day written to all of them as to what they can offer, but I want your opinion. Will you let me have it?

N. Y. J. E. CORLIB.

We are receiving many inquiries similar to the above, and our best judgment is that, with shrewd and wise selection, there is the best of opportunities in the Northern Wisconsin and Minnesota lands for bright, progressive young farmers of limited means. The pioneer life of to-day is not what it was fifty years ago—then it meant hardship and sacrifice that only courageous and, in some cases, the indifferent could accept but to-day in Northern Wisconsin and Minnesota, are lands as good as the sun ever shone upon, that can be bought at extremely low figures, and in sections where it is settling up rapidly and with the advantages of railroads and excellent markets near by, with school houses and creameries within reach, and our best advice to you and others similarly situated and similarly inclined, is to read these advertisements in the DAIRYMAN and write to the advertisers. Opportunities are offered those limited in means, that, if they are capable of intelligent and progressive work, will in a very short time land them the owners of as fine a farm and home, and under as favorable conditions, as they could ask for.

Our Special Elgin Letter.

ED. HOARD'S DAIRYMAN:—The official market was reported firm at 21 cents. There was a decrease of 12% in the weekly output for the district.

CANTON, N. Y., Oct. 19 —Cheese—Offered 2,110 boxes of Twin cheese, 1,076 tubs of butter. Cheese sold at 11½c; butter, 20¾c.

WATERTOWN, N. Y., Oct. 19—Cheese—Sales 5,500 at 11c for large and small.

BALTIMORE MARKET.

BALTIMORE, Md., Oct. 15. —Butter—When we made our report last week, onr market was rather quiet and about steady. On the next day there was a better feeling prevailing, and confidence was soon restored, and at the close of the week the windup was quite firm at ½ cent advance over previous quotations. So far this week with the receipts fully up to expectations, the trading has been quite good, particularly for consumptive purposes. The orders from out-of-town trade have been fairly good, especially for firsts and good seconds; and taking all things into consideration, the situation presents a healthy appearance. Choice imitations and ladles are in fair request at steady prices. Good to choice packing stock has also moved out fairly well, while rancid and cheesy stock is slighted. Blocks and prints continue in fairly liberal supply: choice to fancy lots meet with prompt sale. The market at the close to-day ruled firm at prices quoted, on all desirable offerings.
Creamery Separator, extras, 21½@22c; firsts 20-½@21c; seconds, 18@20c. Imitation Creamery, extras, 19c; firsts, 17@18c; seconds, 15@16c. Iowa & N. W. Ladle, extras, 16½c; firsts, 15½@16c; seconds, 14@15c; Ohio & Indiana Ladle, extras, 16½c; firsts, 15@16c; seconds, 14@15c. Creamery blocks (2 lbs.) extras, 23@23½c; firsts, 21½@22c; seconds, 20@21c. Creamery prints (⅓ lb.) extras, 24½c; firsts, 22½@23c; seconds 20@21c. Md. Va. & Pa. prints, extras, 22@23c; firsts, 20@21c; seconds, 17@19c.
Eggs—While the general receipts have been quite liberal, the supply of new laid eggs have been barely sufficient for the requirements, while so-called fresh are in full supply. The market on fresh receipts rules about steady, at 22c. Storage Eggs—The offerings just now are more than ample for the present needs; the market on them closes quiet, but steady.
301 Exchange Place. G. M. LAMB & BROS.

NEW YORK MARKET.

NEW YORK, Oct. 17—Butter—Receipts for the week, 39,042 packages.
Exports for the week, 2,268 packages.
Receipts show quite an increase over the corresponding week one year ago, and are very liberal for the season; yet the proportion of extra creamery is so small that some buyers had trouble in getting their weekly supply and the pick of fancy, fresh creameries sold at a premium of ¼ to ½c over our highest quotation.
Firsts were in good demand and sold up clean at, say, 20 to 21c; poor, off flavored, streaked and over colored creameries are hard to sell at over packing stock prices. There was a very fair quantity of August and September creameries taken out of freezers and distributed among retailers at about same prices charged for fresh goods, and everything considered, trade has been good, strong and healthful for all table butters and prices close firm.
New York State dairy is in light receipt and wanted. Ladle goods were inquired for by both export and home traders and desirable lots were hard to find. Renovated is only salable at low prices. We quote:
Creamery, extra, 21c; medium, 20@20¾c; poor, 5@18c. Dairy, extra, 20c; medium, 17@19c; poor, 14@16c.
Cheese—Receipts for the week, 27,548 boxes. Exports, 2,502 boxes.
The market has gone from bad to worse and prices are fully ½c lower on full creams and 1c to 2c per pound off on skims of all grades. At the close there don't seem to be demand for the latter at any price. We quote:
Full Cream, extra, 11½c; medium, 11@11¼c; poor, 10@10½c.
Eggs—Receipts for the week, 41,404 cases.
The demand continues good for new laid eggs and best marks of storage goods are wanted at advanced prices. We quote:
New York & Penn., new laid, per doz, 26@28c, Northern & Western, new laid, 25@26c; all sections, poor to good, 18@24c. Refrigerator stock, poor to fancy, 19@22c. DAVID W. LEWIS & Co
177 Chambers St

CALIFORNIA DAIRY MARKETS,

SAN FRANCISCO, Oct. 17—Prices for Butter showed no further depreciations yesterday, but the market still presented an easy undertone, with heavy holders still urging sales by accepting shaded rates. Despite the general easiness of the market trading was cautious and buyers limited their operations to small parcels for immediate requirements While the top quotation was still obtained for the favored brands of Creamery it was only in a small way, the bulk of the day's transactions being closed around 28c, which figure was generally regarded as conservative. The movement in storage goods was still of good volume, operators still finding the handling of this stock most profitable. The situation in the market for ranch eggs was without material change, offerings continuing very light and holders being able to secure any reasonable price they had a mind to ask. While quotations show an advance of a point some holders of selects demanded from ½c to 1½c in advance of the top quotation and secured it without difficulty. There was a lively trade in storage eggs and the market was firm at quotations, with a strong upward tendency apparent. Cheese was in good demand and fancy mild new was reported firm at full figures.
Receipts yesterday aggregated 20,500 pounds butter, 665 cases eggs and 5400 pounds cheese.
Butter—per lb.—Creamery, extras, 28@29c; creamery, good to fancy, 25@27c; dairy extras, 24@25c; dairy choice, 22@23c; store, 18@20c: California storage, 24@27c; Eastern creamery, 23@25c.
Eggs—Per doz—Ranch, selected, large, 46@47c; Ranch, good to choice, 41@45c; store, nominal; California storage, 27@30c; Eastern, 23@28c.
Cheese—Per lb—California creamery, mild new, extra, 14@15c; California creamery, mild new, choice, 13½@14c; Young America, 14@15½c; Eastern, New York cream, Cheddars and flats, new, 14½@16c.

READING NOTICES.

All Reading Notices under this head are at the ate of 25 cents per line.

Wanted—Good milker and butter maker. Man capable of taking entire charge of small herd of thoroughbred Jerseys. Must have had experience in raising calves. Steady employment at good wages for competent man. M. E. REEDER, R. F. D. No. 2, Muncy, Pa. 37-2

For Sale—3 Scotch Collie puppies 7 months old; old male sable and some white; sire and dam registered. Also 4 Holstein bull calves 3 to 8 months old; sire, Sir Dairy B. M. DeKol, and out of choice cows. HENRY WALSH, Sheboygan Falls, Wis. 37-4

For Sale—A 2-year-old registered Jersey bull and a registered Jersey cow soon to drop her 4th calf. These are fine animals. Address JAMES M. ROGERS, Elsberry, Mo. 37-2

Wanted—Position by capable butter maker of 15 years experience in creamery in R. R. town. married. Use no liquor or tobacco. Address COMPETENT, care Hoard's Dairyman. 37-3

For Sale—1 fine Guernsey bull 6 mos. old, finely bred. H. C. COOK, Rosston, Pa.

For Sale—One Acme De Laval belt separator good as new. Reason for selling, want steam machine. B. B. PERKINS, Carson, Ia.

Wanted—A partner in a bottled milk business in some American city in the East or Middle-West. Could supply a lot of modern, up-to-date machinery necessary, or would sell machinery. Correspondence invited. References exchanged. Write quick. Address C. H. McNISH, Lyn, Ont., Can.

Wanted—Position on dairy or stock farm as herdsman or foreman by an up-to-date capable man of 15 years experience. Graduate of Wis Agr. College. For further particulars address ABE SAUERS, Mt. Vernon, Ohio.

Situation Wanted—On a first-class dairy by a married man 30 years of age. Small family. Good milker and all round experienced man. Wages $35.00 per month, house, milk, garden, etc., furnished. Can come at once. Address DAIRYMAN, 800 So. East 8th, Des Moines, Ia.

Wanted—At once, a man and wife experienced in dairy work. Wages $35 00 per month and new three room dwelling. In writing state age, nationality, and give references. Address WM. J. HOFSOMMER, Breese, Ill.

For Sale—Finely bred St. Bernard puppies $10 00 and $15 00. Address O. N. JOHNSON, Fond du Lac, Wis.

For Sale—In California a well established milk route, 10½ acre dairy ranch and 33 head well bred dairy stock. Thrifty, healthful and beautifully located settlement in South California. Address P. O. BOX 1, Escondido, Calif.

ONLY REGULAR AWARD, CHICAGO, 1893—GRAND PRIZE, PARIS, 1900—ONLY GOLD MEDAL, BUFFALO, 1901

A WORD TO
Cream Gatherers and Centralizers

It is well to remember that

DeLaval Cream Separators

Good management, and creamery success have ever gone hand-in-hand.

There is no enduring profit or benefit to anyone in either the use or sale of second and third class cream separators—whether factory or farm.

Nearly all the large promoters of the sale of farm separators are handling the DE LAVAL machines and doing so with profit and satisfaction to all concerned.

Some few who have first tried cheaper, large discount machines are changing over now and will be in the DE LAVAL line in future.

Some few who have not are beginning to reap the troubles they have sown and the most conspicuous one is now in financial distress.

The moral of all of which is that it is a good time now to get in the DE LAVAL procession for 1904, as there surely won't be enough DE LAVAL machines to go round a few months later on.

Guernsey Bulls for Sale—I have a few young Guernsey Bulls for sale at Moderate price, ranging from six months to one year old. These animals are from highly bred sires and mothers of good size and well reared. Good bargains here. W. D. HOARD, Fort Atkinson, Wis. 30-tf

Do You Want—A Hay Fork Returner? Every farmer having a barn should have one. A hummer for agents. Circulars free. ROONEY RETURNER CO., Box D., Independence Iowa. 50-tf

For Sale—Young bull fit for service, sired by Recorder 29339 and tested dam 16 lbs. 2 oz. Sold at a sacrifice. JOS. KARELS, Big Stone, S. D., R. 1 30-tf

The Third Revised Edition of Buff Jersey's Popular Book Just Out of Press—Ten chapters, 25 illustrations and right up-to-date. Subjects treated are: Silos and Ensilage, All Phases of the Dairy Subject, Soil Crops, Up-to-date Farm Machinery, How to Cure Abortion and Milk Fever, Seme Medicines and Remedies, The Steam Plant, its care, and many other valuable things ably treated. Send for circular. Sent post paid, cloth binding $1.00, paper 75c. BUFF JERSEY, Monmouth Ill. 47 tf

Holstein-Friesians — Registered cows and heifers, singly or by carload. Also bulls 1 month old to service age. Richest blood of the breed. KNAPP & PIERCE, East Claridon, Ohio. 33-5

For Sale—One carload of Jersey cows. Thoroughbreds and grades; also a few Holsteins. For particulars and specifications address BYRON PARSONS, Havana, N. D. 35-4

Wanted—An experienced farmer and dairyman, married, with two large boys, to farm and milk and care for 40 cows. Stable has cement floor and water in every stall; stalls are Bidwell. Milking hours 4:30 a m. and 2 p. m. Wages $800 per year with house rent and garden. State your experience and give references. Give ages of members of your family. J. P. WATTS, Kerrmoor, Pa. 36-2

For Sale—Five cheese factories, 20 acres land, saloon and store with stock, three houses in Appleton, Wis., two farms 60 and 80 acres. Address 775 Ida St., Appleton, Wis. 36-tf

For Sale—One fine registered 18 months Guernsey bull. Address EDWARD DIETZ, Hyde's P. O., Md. 36-3

For Sale—Choice pedigreed O. I. C. Pigs 12 weeks old at $8.00 each. S. J. HOWARD, R. F. D No. 1, Henderson, Ky. 36-3

For Sale—Holstein bull calves, one 3 weeks old and two 8 months old; average official 7 day 80% butter records of dams and sire's dam is as follows: 19.5 lbs., 18.5 lbs., and 20.7 lbs If you want a calf worth the money write quick to F. G. JOHNSTON & CO., Sta. B., Columbus, O., owners of the Business Herd of Holstein-Friesian Cattle. 36-2

For Sale—One choicely bred Guernsey bull by Stella P's Gold Bar, 8368, out of my best cow, 16 months old, warranted a sure stock getter. Also a few choice Berkshire sows and boars, April farrow, at reasonable prices. J. E. STORY, Successor to Nor. Wis. Live Stock Co., Stanley, Wis. 36-tf

Wanted—Situation on dairy farm by single man, good milker and dairy hand. 5 years experience. Address BOX 956, Port Huron, Mich.

Wanted—A position Jan. 1st, 1904, as buttermaker in a good creamery. Have had twelve years practical experience making butter, two years at present place. State wages in first letter addressing J. O. N., care of Hoard's Dairyman.

For Sale—30 h. p. boiler and 20 h. p. engine; 12 h. p. traction engine; several small engines; gasoline engines from 1½ to 50 h. p. BICKNELL HARDWARE CO., Janesville, Wis.

Wanted—A position as butter maker in creamery. Will make cheese if desired. References furnished. Address P. O. BOX 189, Fairfax, Vt.

For Sale—Seven fine Holstein cows from 2 to 6 years old, 2 heifers 6 and 11 months old, a grandson of Manor DeKol nearly 2 years old, also bull calves. S R. FUGGLE Delphi Falls, N. Y.

Jersey Cows and Bulls for sale cheap. D. D. JONES, Orwell. Pa.

I own the only American patent on Automatic Recording Scale for dairy use. Have model which works to perfection. Will cost very little to manufacture; is simple and durable. I will sell the patent or will sell part interest to some enterprising party who will push the sale. Correspondence invited. Circular free. C. I. HUNT, Patentee, Hunt, N. Y.

For Sale—Creamery plant doing fine business, with rooms for family; large barn; in beautiful village with high school and in best dairy district on Puget Sound. Price $2,400 cash. Address E. I. THOMPSON, Everson, Wash. 35-4

For Sale—480 acres, 200 level, 160 acres Gov' land can be added by using homestead right, making 640 acres in one piece. A well equipped dairy of 30 cows, with gas engine; 40 acres fine grove, plenty water in grove. Good buildings, very rich soil; called the finest outfit in the county. Will give possession any day and give ones own time to pay for last half if ten years; terms at 6 per cent. I mean business. $9600 is the price, you will say it is worth $14000. Address F. A. I. R., care of Hoard's Dairyman. 30-tf

Herdsman Wanted—Who understands care and handling of thoroughbred Holsteins as well as rearing of young stock. Single men only need apply. State wages and experience. Steady place for right party. Address A. J. DAUGHERITY, Streater, Ill. 34-tf

For Sale—In car-load lots, fresh milch cows, 8 Springers. E. M. BOURNE, Wiota, Iowa. 34-2

For Sale—A cheese factory in good dairy country. Doing good business. No opposition, (cheap.) Address S. O. U., care Hoard's Dairyman. 34-tf

For Sale—Two registered yearling Guernsey bulls. RAY BICKNELL, Ft. Atkinson, Wis. 32-tf

Excursion Tickets to St. Paul and Minneapolis and Return—Will be sold by the North-Western Line daily until Nov. 30, 1903. from Fort Atkinson at $14 00 for the round trip, limited to return until Dec. 15, 1903. Apply to agents Chicago & North-Western R'y. 35-8

Homeseekers' Excursions to the Northwest, West and Southwest, and Colonist Low Rates West—Via the North-Western Line. Excursion tickets at greatly reduced rates are on sale to the territory indicated above. Standard and Tourist Sleeping Cars, Free Reclining Chair Cars and "The Best of Everything." For dates of sale and full particulars apply to agents Chicago & North-Western Ry. 53-8p

Note and Comment.

Effect of Embalmed Milk—The Weather in Ohio—A New Silo—Apples and Cows—A New York Dairyman and the Dual-Purpose Cow—The Winter Stable—Feeding Grain.

ED. HOARD'S DAIRYMAN:—We had a little to say in a recent DAIRYMAN about the strange state of affairs existing in Lincoln, Neb., dairymen using formaldehyde in milk galore, and the Mayor defending them in court. Apropos to this, the Lincoln *Star*, in its last issue, reports that a milkman coming into the city was accidentally killed by the overturning of his wagon, and two cans of the milk spilled over him, and so well had the milk been "doctored" that the body was perfectly embalmed. The report seems an unusual one, but the coroner has heretofore borne a good reputation as to truth and scientific accuracy.

Both the weather man and the moon-sign scientists are puzzled over weather conditions in Ohio this season. For a territory 50 miles or so wide, on the south shore of Lake Erie, there has been an almost incessant fall of rain for months, interfering with all kinds of work and silo filling in particular, while just to the south, not 75 miles from the lake, the drouth is simply terrible, and for months not to exceed an inch of rain has fallen, and fall work is at a standstill, and fighting fires is the rule. It is pretty hard to predict weather along an east and west line where on one side it rains, and the other a dew is regarded as a blessing, and then have a wet and dry moon hung out the same night to confirm the beliefs of both parties. That's a dual-purpose moon, sure. In the "wet" section fall feed is an abundant factor, and the cool, cloudy, wet weather has so retarded the corn ripening that this 8th of October finds the corn in its best state for milch cows, and judging from my own dairy, the milk flow is abundant. Silo filling has been greatly delayed, and hundreds are yet to be filled, owing to the great rains. Corn fields are mire holes, and silo filling is anything but a joy and delight.

Some genius, name and residence unknown, has in a moment when not influenced by politics, conceived the plan of building a wooden hooped silo in three sections, splicing on a hoop and setting the joint in putty paint and then cleating on the outside with some hard wood 2×4's to hold the sections together, and then covering as usual, to protect the hoops and silo itself. It is something of a trick to build a wooden hooped silo to get the hoops plumb, and get it going all right, but by this plan the three sections are built on the ground, the only great skill being to have the top hoop of each section come up half its width above the end of the ceiling lumber, so to have a good splice. The two sections are "hoisted" into place with pully blocks, and then stayed. Wonder if that is not a pretty good way. What does Geo. Scott know about it? Would it be a good thing for "dairy straws?"

Quite a discussion is going on in an eastern paper about cows breaking into orchards and eating so many apples that they become drunk, and some of them will lie two or three days before they begin to "feel all right in the head again." The scientific man asserts that the ferment of what apples a cow will hold, will not develop alcohol enough to produce drunkeness, and that it must be something else that sets in that gives them this apparent maudlin stupor. Well, what is it then? Several years ago we had a cow break into the orchard and was for two days very similar in her actions, to that displayed by a "foreign nobleman," who lay on the grass on the other side of the railroad fence, who was drunk. Possibly he was not drunk, but his condition was attributable to too large hand-me-outs of apple pie, at contributing farm houses. Intoxicated, or a victim of distressed circumstances, a cow, gorged on apples, is greatly injured in her after milk flow, and the difference will fix the fence, before hand, four times over.

In regard to feeding apples, I am a little distrustful about there being any advantage in feeding cows apples, as a part ration. In my loose way of making experiments, I never saw that I was paid for the time in picking them up, let alone carting, though the Vermont Station finds a fair value in sweet pomace which is quite another thing from the apple before the juice is expressed for the making of family vinegar. Possibly some kinds and varieties are better than others. Which is the cheaper raised, 2,000 bushels of apples, or 2,000 bushels of silage, and which will make the most milk?

Herbert E. Cook, of Denmark, N. Y., is New York's most thorough and practical dairyman and his cow lore is beyond the books. Several years ago he had the dual-purpose idea well developed and later on the cross-bred cow, uniting two of the best dairy breeds. He found the first cross a fair cow, but not as good as either of the foundation stocks. Now for years he has been lining up with one breed, and is making a great dairy out of this straight and away method. In a recent letter to a journal I find these three sentences, which contain a mint of suggestion: "The cost of production today is tremendous. Milk must be produced with a cow machine especially adapted to the work in hand. Any community that goes "crazy" over the milk business with a combination cow, will sooner or later regret its "insanity." Some people do not find out in their lives what they are fitted for, so with the dairyman with dual-purpose cows. This (dual-purpose) matter is a grevious error. Now and then a phenomenal cow is produced, only often enough to prove the rule, that milk and beef are not found in perfection in breeds, or combinations, as a whole." The milking of beefy cows is dairying on the ragged edge. The eastern DAIRYMAN's is succeeding in competition with the west, only because he is not handicapped with a beefy cow. From the DAIRYMAN's standpoint is there anything the matter with the above "Cookies?"

Of course everyone has fixed up the cow stable for winter, whitewashed it, put in four more good sized windows to let in the sunshine, battened it all up snug and warm, put in a ground flue from the stable floor to take out the bad air, had the water trough fixed, and the tank set so that the cows will not have to be turned out stormy days, got some road dust and some plaster to sprinkle in the gutters and a nice lot of bedding ready, and—what? All fancy farming, and don't amount to a cent? Well we know it does and no argument needed.

We have a lot of poor dairy cows in the east and middle states that are so because they are cared for by a poor dairyman, and a man who is a great friend of timothy hay, cut after August 15th. True, some cows die without knowing "whether or no" they were intended to give milk or not; and hundreds of other poor yielding cows are poor because they never had an up-to-date barn, owner, or milk producing food to promote milk giving. Feeding a cow is not just giving her a fill of grass when fresh, but a generous feed every day in the year of something besides grass. What if they do get fleshy while resting? I have lost all fear of flesh injuring a cow before calving. I am aware that about all the ills and troubles that used to beset the dairy before we had the fancy frills on cow care have disappeared, and if one ever had a healthy dairy, I have one; and that with cows that are not out of the stable 50 hours altogether, from Dec. to April; cows that have some grain every day in the year, possibly not ground grain when well eared corn fodder is being fed to them the month before dropping their caves, but the other eleven months. Of course all the readers of HOARD'S DAIRYMAN need none of the above advice, but the fellow "who has dairyed it all his life" still has some queer notions about cow keeping.

JOHN GOULD.

Twentieth Century Farming.

Success with the Dairy—Treatment of the Cow Influences the Product—Care of Milk.

Very few dairymen comprehend the effect of personal treatment upon the dairy cow. The better bred and higher the producer, the more marked this difference. Twenty per cent difference in flow is not uncommon between two milkers in a herd of cows, where feed and care otherwise are the same. A cow soon comes to know the person that handles her and to like or dislike him, according to the manner of treatment she receives from him.

An illustration in point. The cow mentioned in a previous number of this series—a cross-bred Jersey-Guernsey—that

A GREAT SUCCESS.

The goods are free if you send thirty-five cents to pay part of express charges and to prove you are interested.

M. H. FAIRCHILD & BRO., 199 MICHIGAN STREET, CHICAGO

produced over 10,000 pounds per annum was my family cow. Nearly all the time she had my personal care daily. A retired old farmer, who had cared for cows all his life, kept his horse in the same barn, and was familiar with my methods of caring for the cow. I had occasion to be gone from home a couple of weeks, and he kindly offered to care for her while I was away. On my return I found she had dropped off on her flow fully 20 per cent. The old gentleman said to me: "I have milked that cow and cared for her as nearly as I have seen you as I knew how, but for some reason I have not been able to get from her the quantity of milk I see you take from her day by day." As soon as I went into the barn, the cow showed her pleasure at my return. Within a week she had returned to her former normal flow. Pencil and paper need be used but a moment to show what this difference means in a herd of twenty cows. Five pounds a cow would mean 100 pounds of milk, or about $1 loss a day.

I have read of some cranks, and heard others say they would not allow whistling or talking in the stables where cows are. This is all bosh. The man who has the charge of a cow should speak to her every time he comes near her, and especially every time he puts his hands on her, always calling her by name. She will come to know her name, and expect to be spoken to and be treated in a social manner whenever the man in charge is near her. She should become familiar with the tones of his voice, and those tones should be pleasant ones. It is very rarely, indeed, that a blow to a cow is justifiable. Any ill treatment must be paid for at the milk pail.

There are on the Delaware river two dairy farmers whose farms lie on the opposite sides of the stream. There is not a marked difference between the feeding and pasturage of the two herds, or the quality of the cows. I found one of them producing fully 25 per cent more butter a cow than the other. One treated his cows kindly, and they paid him at the pail. I went with the other after his cows. He had a vicious dog that went with us. The moment we arrived at the pasture bars, the dog gave a yelp and started for the cows. They evidently knew what it meant, for all started on the run in different directions. The dog had nipped the heels of every one of them before they got to the barn. When the milking was done the cows at once appeared frantic to get out of the stanchions. As the cows were released the dog managed to nip the noses of nearly every one of them before they could get free from the stanchions, and all before they got from the yard.

The owner of the cows said to me that his neighbor across the river claimed to be making a great deal more butter a cow than he was getting; that he did not believe it, for he had just as good cows and fed fed them just as well and had just as warm stables. A single hour passed in the two herds at milking time showed very plainly the price the latter one was paying for the manner in which he treated his cows. The cost of keeping the two herds a cow was practically the same, and yet there was 25 per cent difference in the product, arising solely from the different manner of treatment.

How many thousands of dollars are lost annually to the dairymen of the state of New York from the same cause? If an accurate answer to this question could be made the result would be appalling.

To do her best the cow must come to know her attendant and come to like him. She should become familiar with his whistle, his voice, and know the touch of hand. She must be milked as nearly as possible at the same hour each time, and in the same order in relation to the other cows. A creature of routine habits easily formed, she resents at the pail any interruption of those habits. The higher type of producer, the more sensitive she is to these changes. The 3,000 pounds a year scrub can be treated in almost any way and not show such marked results, but the cow that, on proper feed and care, will produce from 8,000 to 10,000 pounds per annum will increase the difference mentioned many fold.

When the cow has delivered into the pail the milk in good condition, her part of the work in the well conducted dairy is done. That of the skilled dairyman is but fairly begun. There are enough "leaks" between the cow and the butter tub to absorb the major portion of the profits of the dairy. Microbes and bacteria are among the great enemies of the dairy. We are informed they multiply many times an hour. A comparatively small amount finding their way into the milk pail before leaving the barn may so increase as to make first-class butter impossible, no matter what pains be taken with the product from that time on. Clean cows, clean udders, clean and pure milk pails, and above all, clean attendants and milkers are indispensable to the profitable and well conducted dairy that is to furnish butter to the epicurean tables of the present century. First-class butter is being and will be produced. It will be in the markets where lovers of that kind of article can procure it. The dairyman that produces it is the one that will get a good price for his product and make a handsome profit from his dairy. If dealers cannot get a first-class article at home, their customers will require them to send where they can procure it.

Given a pure milk, properly produced, in a manner that gives the dairymaid an opportunity to give her skill a fair show, a few words as to the treatment of milk after it reaches the dairy may not be out of place. Much has been written upon this subject, but "line upon line, precept upon precept," is the price to be paid for advanced farming. Every tin vessel about the dairy should be so soldered that no place is left at the seam for material to be secreted and become foul. Milk should be removed to the dairy room as soon as possible after being drawn from the cow. With the dairy room clean and all drains kept so cleansed that no foul odor can reach the room, the balance of the work is largely routine, with a liberal amount of common sense mixed in.

There are two ways of successful creaming of the milk—the separator and the cold water, gravity process. I give the latter for the reason I have tried it the most throughly and like it the best. As the result of experiment I discovered that a double setting in the "Cooley" can, or others of like process, would cream within one-half of one-tenth of 1 per cent, which is as close as is practicable with ordinary work with the best separators. I have a box with two compartments made deep and large enough to contain the cans needed in my dairy, the size to be proportioned to the amount of milk to be set. I have a stream of spring water running into the one apartment, and water with plenty of ice in the other. The spring water stands about 54 degrees in warm summer weather. When the milk is strained the cans are set in the apartment containing the spring water for about two hours. It is then carefully lifted and immersed in the apartment containing the iced water, where it remains for about twelve hours longer. This process saves about one-third of the ice, and the double shock occasioned by first immersing in the spring water and then in the iced water results in a thorough creaming of the milk.

It is claimed by the separator people that the separator takes out more of the impurities than the gravity process. I do not believe this is true, for the separator takes it out because it is the heaviest material in the milk, and the same reason would put the impurities at the bottom of the can, to be drawn off with the skim milk, while the cream rises to the top because it is the lightest. I know of no person that has ever given a scientific test to learn which takes from the cream the impurities the most thoroughly.—C. L. PECK, in *Tribune Farmer*.

The New 1903 REID HAND SEPARATOR

The 1903 Reid Hand Separator is the most exact milk skimmer ever made—it is simplest, fastest, lightest running, and affords most butter-producing material under all conditions. It creates a new source of revenue and maintains the income—

WEARS LESS, LASTS LONGEST

Every Reid Hand Separator is sent out under a positive guarantee, and is sold on its own merits. If you want a separator we will send a Reid on approval—work it ten days and if it does not excel all others return at our expense. Send for new catalogue and revised price list, mailed free.

A. H. REID, 30th and Market Sts., Philadelphia, Pa.

THE Iowa Dairy Separator.

AN UP-TO-DATE MACHINE REPLETE WITH PRACTICAL IDEAS

It is built in the following sizes:

250, 350, 450, 600, 750 POUNDS PER HOUR

Our 750 pound per hour machine is a practical Hand Separator. It is as easily run as most separators of 450 pounds and 500 pounds capacity.

NOW IS THE TIME TO SUBSCRIBE FOR Hoard's Dairyman.

Dairying in October.

ED. HOARD'S DAIRYMAN:—At the meeting, last week, of our local cheese board, cheese sold for 12 cents per lb. and was eagerly bought up at this unusually high price. That's a good price for September cheese, and means 90 cents to $1.00 per cwt for the milk furnished the factory. And yet, in the face of this phenomenal price for cheese, the majority of factory patrons by no means are going to take advantage of it. Many of them have already withdrawn from the factory asserting (which is true) that they have no milk, and, what milk they have, they need at home to make butter for the winter. It is quite true that the majority of cheese factory patrons have so little milk to send away now (October 8th) that it is hardly worth the while bothering with it at all, and the milk drawers find it hardly pays to keep on the route, while a few of them are now going along only every other day.

Now, this should not be. October, every man of experience in the cheese business will tell you, is one of the best months in the year for milk. In October, the field crops are all taken off and housed and the cows may have recourse to the grain field, hay fields, etc. There is plenty of fodder at this time, sheaf oats, hay and cereals of all kinds, not to mention roots, which may be fed to the cows in variety. Ah! but this feed is not for the cows. The grain must first be threshed, then sold, and the straw will be for the winter feed of the cows. The roots will be required for winter feed also to take them through the winter. Who expects a cow to bring any money in the winter season? This is a bad state of affairs and one that does not seem to improve with age.

The dairy business is now an old one, and most farmers have given it a try. If it were not a paying business these people would not continue to send milk to the cheese factory every season. Then, if it is a paying business, which it undoubtedly is, why not follow it up and make provision for its extension well into the winter? What profit can men expect from patronizing a cheese factory for four or five months in the year. Paying board for five months and jumping the board bill for the other seven is not going to work. But this is how it is.

There is no occasion in the world for the milk yield to have been reduced at this time. As already said, October is one of the best months for milk, other things being equal. Of course when the cows have been allowed to shrink in September, before the harvest fields were cleared, it is almost a matter of impossibility to regain the milk flow any more in the fall, and the increased pasturage and feed in October does not help very much. It is only for those who fed well in the drought and seared pastures of late August and first September who get the advantage of the better pasturage of late September and October.

To feed a cow good, sound grain, or good grain in the sheaf, seems to be considered a heresy by a great majority of the factory patrons, and to purchase concentrated feed is, of course, out of the question. They expect to have the cake and eat it. They expect, further, to get blood out of stones. They expect the cow to yield milk out of nothing, and when she refuses to do this, there is nothing then to do but cut stick and quit.

They certainly expect the cow to be a creature of wonderful possibilities indeed. An engine will not run without fuel in the shape of coal or oil, and yet they expect the cow to manufacture milk from nothing, or next to nothing. Next

AYRSHIRE CATTLE of the BEST of BREEDING. Also Chester White Pigs, ready to book for season's trade. Young stock of both sexes. Prices reasonable. Come and see us.

Just for Nothing

We will send you THE JERSEY BULLETIN and HOARD'S DAIRYMAN to the end of 1903. But while making you this generous offer, we wish you to do something.
Subscribe for both papers for 1904, at the lowest clubbing rate, $1.75 FOR THE TWO. To make it plain, send us $1.75 and we will send THE JERSEY BULLETIN and HOARD'S DAIRYMAN to January 1st., 1905.
For Sample Copy of Jersey Bulletin address Indianapolis, Ind.
"IT'S UP TO YOU!"

to the impoverished fields of mother earth, the cow—the dairy cow—is used worse, treated worse, than anything on the face of the earth.

I often think, and so remarked, that dairying through the factory, is never given a fair and square show, and too much is unreasonably expected from it.

When a man, who has previously been in the habit of, say, growing grain for sale, and some roots, with possibly the sale of some live stock, begins to patronize the factory, he possibly makes anywhere from fifty to one hundred dollars in the factory season, from the sale of his milk—an income which he probably never previously enjoyed. Here is an addition to his income of fifty or a hundred dollars, and he has his grain crops, and other live stock to dispose of as usual.

Now, what is the reason this man, seeing that his cows brought him in a hundred dollars does not give back some of this money to the cows, in the shape of that grain and those roots, besides that hay he is accustomed to sell? Can he not afford to feed or reserve for those good cows, which brought him in the extra income, at the least to the value of half of what they made for him? If they made one hundred dollars for him this season, why not reserve at least fifty dollars' worth of grain and roots to feed to these cows during the fall and early winter if he is a cheese factory patron?

By so doing he will still be ahead $50, over previous years and may sell, as usual, the surplus grains, etc. But this is just the very thing the average cheese factory patron will not do. He must have his cake and eat it. He continues in the same old rut of raising grain, hay and roots for sale, while he expects that his scrawny cows will bring him a respectable sum also. This is dairying with a vengeance. It is this parsimonious class who would like to see the factory close down in September. The advanced patron who wants to keep on, has a hard time with these fellows, and they are legion. There is no reason in the world why October should not bring as much milk as September, and bring milk, too, when the milk is of greatest value.

A hundred-weight of milk in October is worth usually (it is this year) as much as 150 lbs. in June. If the herd which yielded 100 lbs. in June, yields but 66 lbs. in October, they are bringing in just as much money. This rule obtains almost every year as well as it does this one.

With a good feed of corn fodder at night, cows will milk, or should milk, well this month, with the increased range of pasturage and the aftermath of the fields. In our own small herd the milk has gradually increased since the middle of September and we are now getting more milk than we were Sept. 1st. There is no reason at all why this should not be general. We have no secret about the business. Our cows are not of an improved breed, not even grades. Our pasture is nothing great, neither are our advantages for water. We simply grasp the great fundamental principle that milk cannot be made out of nothing and that it pays to turn the rough feed and grain of the farm into milk, and save a lot of labor withal, and that a cow must be filled to the brim with food and water before a maximum amount of milk can be expected from her. J. A. M.

P. E. I.

FINE POULTRY FOR SALE

I offer a very select lot of **White** as well as **Buff Plymouth Rock Fowls** of the present year's breeding for sale. Each breed have been kept on separate farms and are absolutely pure in their breeding. They will be sold at

$5.00 A TRIO

Nicely crated on board of cars here.

Single Fowls, $2.00 Each

They have had the range of alfalfa fields the past summer and are very vigorous.

Holstein-Friesian Breeders Third Semi-Annual Consignment Auction Sale
414 South Clinton Street, Syracuse, N. Y.,

WEDNESDAY, OCT. 28th., 1903

I am instructed by the following well known breeders to catalogue and sell on the above date one of the most selected and choice lots of Holstein-Friesian Cattle ever yet offered to the public, consisting of cows and heifers with A. R. O. butter records ranging up to and over 21 lbs. each. Young bulls, cows and heifers whose dams have A. R. O. butter tests ranging up to 25 lbs. These choice females and several others bred to such noted bulls as Mercedes Julip's Pietertje Paul, Beryl Wayne's Paul De Kol, De Kol 2nd's Butter Boy 3rd., Mutual Friend 3rd's Paul, Johanna Rue 3rd's Lad and Sir Korndyke Manor De Kol. The contributors are A. A. Cortelyou, Neshanic, N. J.; F. P. Knowles, Worcester, Mass.; T. A. Mitchell, Weedsport, N. Y.; H. L. Bronson, Cortland, N. Y.; Stevens Bros., Lacona, N. Y.; H. A. Moyer, Syracuse, N. Y. Communications and applications for catalogues, which are now ready, can be addressed to either of the contributors, or

W. C. HUNT, Sales Manager, Liverpool, N. Y.

The above breeders will hold their next Auction Sale on the New York State Fair Grounds, Syracuse, June 2 and 3, 1904, the two days following the next annual meeting of the Holstein-Friesian Association. This will be made a regular annual event.

HOLSTEIN BULLS.
We have some grandly bred young bulls ready for service. One of the largest and best advanced registry herds in the United States.
PIERCE LAND & STOCK CO. 14 Turk St. San Francisco, Cal.

THE LAKESIDE HERD OF HOLSTEIN-FRIESIANS 65 head in number, is situated within 10 rods of the C. & N. W. depot. Stock of both sexes and different ages for sale. Bulls in service are: Homestead Prince De Kol No. 25863. Sire: Pietertje Hengeveld Paul De Kol No. 22128. Dam: Shadeland De Kol No. 41386 A. R. O. in 2 y. f. milk 383.2 lbs., butter 15 lbs. 5.3 oz. and Canary's Mercedes Sir De Kol No. 29175. Sire: Count Colantha Alban No. 25148 Dam: Canary's Mercedes No. 12586 A. R. O. Milk 409.5 lbs., butter 25 lbs. 2.6 oz. Average per cent fat 4.92. Correspondence solicited.
WM. EVERSON & SONS, Lake Mills, Wis.

FERMANAGH HERD
HOLSTEIN-FRIESIANS

Bulls ready for service from A. R. O. animals sired by Johanna Rue 2d Paul De Kol, sire of 13 A. R. O. cows. Also young bull calves by same sire. **THOS. GAINES, Supt., Arcadia, Missouri**

MAPLES STOCK FARM, PENNELLVILLE, N. Y.
Second Annual Offering
150 HEAD OF HIGH CLASS REGISTERED

HOLSTEIN-FRIESIANS

AT AUCTION, OCT. 14-15, 1903
at Fulton Fair Grounds, Fulton, N. Y. Catalogues ready Oct. 1. Write for one. Address
R. F. D. 3 **John C. Godfrey, Fulton, N. Y.**

VALLEY FARM HERD
HOLSTEIN-FRIESIANS

Headed by Korndyke Queen De Kol's Prince, dam Korndyke Queen De Kol, 24 lbs. 6.7 oz., granddam Belle Korndyke, 25 lbs. 12.3 oz. Both sire and dam by Manor De Kol, his dam Netherland Hengerveld 26 lbs. 10.66 oz., Manor De Kol by a son of De Kol 2d, 26 lbs. 9.21 oz. All are official tests and average 25 lbs. 13.72 oz. butter for 7 days and 3.95 per cent fat in their milk. Two bull calves now for sale and young ones after Sept. 3.
DON J. WOOD, R. F. D. 2, West Winfield, N. Y.

Bulls For Sale.

Two choice bulls ready for service and some fine bull calves from good testing dams. Sire: Paul Clyde, son of Paul DeKol. Dam's record 24.38 lbs. in 7 days. Write **C. A. SNOW & SONS. Athens, Ohio.**

HOLSTEIN-FRIESIANS
INDIVIDUALITY, PERFORMANCE, BREEDING. You need it all. Write or come. 100 head.
McKAY BROS., Buckingham, Ia.

HOLSTEIN-FRIESIANS
FAIRVIEW HERD

We offer bulls ready for service; also heifer and bull calves not related, of the kind to suit the most particular.
O. J. GODFREY, Pennellville, N. Y.

HOLSTEIN-FRIESIAN BULL CALF.

Do you want one for use this winter which will improve your dairy herd? Do you want him elegantly proportioned, with straight back, high rump, and all the dairy points? Do you want one whose relatives are A. R. O., and elgible to the Advanced Registry himself? If so, I have just what you want.
MALCOLM H. GARDNER, Darien, Wis.

HOLSTEIN CATTLE!
The Choicest Milk and Butter Breed in the World. Write to WISCONSIN LIVE STOCK ASSOCIATION, Appleton, Wis., U. S. A.

TYRANENA HERD
100 HOLSTEIN-FRIESIANS 100
A. R. O. Stock For Sale.

Both sexes, all ages. Herd headed by Sir Piebe Hengeveld De Kol, No. 27929, dam Piebe Laura A. R. O., 21 lbs. 8 oz. Average percent fat 4.62. Eight official records in pedigree that average 23 lbs. 5 oz **Frank B. Fargo, Lake Mills, Wis.**

SHADY NOOK HERD
HOLSTEIN-FRIESIANS.
Offers 5 yearling bulls cows and heifers bred to oldest son of Mercedes Julip's Pietertje, No. 39480. Chester White Pigs in pairs and trios, not related.
W. R. GATES, Fort Atkinson, Wis.

OAKLAND HERD HOLSTEINS

PREMIER SIRE **Mutual Friend 3d's Paul** — A son of Paul De Kol & Mutual Friend 3d, 21.84 lbs. butter, milk averaged 4.7% at 3 years. She has two A. R. O. daughters, 1 made over 20 lbs.

Must reduce herd at some price. State just what you want. T. A. MITCHELL, Weedsport, N. Y.

BROOKSIDE HERD
HOLSTEIN-FRIESIANS

To reduce herd to capacity of pasture, will sell a limited number of A No. 1 young cows of high breeding and individually right, large producers, at $150 each; also 15 bull calves at bargain prices,
STEVENS BROTHERS, Lacona, N. Y.

HOME FARM HERD.
Headed by **COLANTHA 4TH'S LAD.** Official test of three nearest dams 25.1 lbs. butter in seven days. Herd numbers 125 head.
BEST FAMILIES REPRESENTED.
Special prices on six or eight bulls of serviceable age. **W. B. BARNEY & CO., Hampton, Ia.**

THE STEVENS HERD
Contains at the present time the young bull, Vale, with the largest official backing of any bull ever born. Several half-brothers and sisters to Vale, and a large number of cows and heifers bred to his sire, whose official backing is larger than that of any other bull ever in service. A cow that stands unequaled by any other that ever lived, in the official work of herself and daughters. The only cow ever officially tested for six months. Eighteen cows and heifers with official 7-day butter records averaging, by the 80 per cent. factor, over 20 lbs. each. Thirty animals whose dams have made official 7-day butter records averaging over 20 lbs. each. Why not get our prices before buying?
HENRY STEVENS & SON,
Brookside Stock Farm. Lacona, Oswego Co., N. Y.

ELMWOOD
Home of Leila Pietertje 27 lbs. 5 oz. butter in 7 days, A. R. O. Two sons, two daughters, and many others closely related to this great cow. Any animal in herd for sale.
GEO. T. McNEIL, Theresa, N. Y.

FOR SALE.

H. F. A. R. O. cows and heifers bred to Duchess Ormsby Piebe Burke No. 29328. Also young calves from same sire. One wishing the blood of Duchess Ormsby, address **W. H. JONES, Watertown, Wis.** Rural Route No. 2.

THE MONONA FARM HERD
OF HOLSTEIN-FRIESIANS

Four fine yearling bulls for sale. Also a few choice bull calves. Paul Calamity De Kol, 31095, at the head of the herd. His pedigree contains ten records averaging 27.32 lbs. butter in seven days. His seven nearest dams average milk record of 69.50 lbs. one day. Breeders and dairymen please write for prices.
F. W. ALLIS,
Monona Farm. Madison, Wis.

JUST BULL CALVES

We have three, that are individually fine. They are bred right, have been fed right, and the price is right.
Ohio's Famous Herd, Holstein-Friesian Cattle. **W. B. SMITH & SON.**
2488 W Broad St, Columbus, O.

Holstein-Friesian Bull Calves
Of Advanced Registry. Young stock from cows testing high in butterfat, at reasonable prices. If you want the best address JOHN SHUGART & SONS, Marion, Ind.

FOR SALE
2 H. F. Bull Calves, 6 mo. old, sired by Johanna Aaggie's Paul De Kol 23443, (160 A. R.) from good milkers and testers.
M. S. CAMPBELL, Genoa, DeKalb Co., Ill.

CLOVERDALE HERD
HOLSTEINS.

Four choice Bulls from advanced registry cows and sire, ready for service, now for sale. Correspondence solicited.

A. J. DAUGHERITY Streator, Ill.

Woodlake Herd.
Advanced registry Holstein-Friesians of leading families at reasonable prices. Small calves of both sexes cheap. **JOHN B. IRWIN,** Station D., R. 1, Minneapolis, Minn.

MARKHAM MANOR FARM,
Simonsville P. O., Andover, Vt.

Holstein-Friesian cattle, bred from the most fashionable butter families, individually large producers, and of the most approved show form. The herd contains seven daughters of Sir Netherland Soldeme Clothilde. No. 1870, H. F. H. B., the most remarkable show bull of recent years. Also large English Berkshire swine from noted prize winning and imported stock. Write for discription and price to **J. A. THORNTON,** Manager, **Simmonsville, Vt.**

HOLSTEINS IN CALIFORNIA

SAN ANSELMO, MARIN COUNTY
250 HEAD IN THE HERD
Sires are sons of Mercedes Julip Pietertje, Colantha 4th Belle Korndyke, Fay Barnham Princess Wayne 7th. A fine lot of bull calves
R. M. BOTALING,
Rialto Building San Francisco, Cal.

FIRST CLASS BULL
Offered at reasonable price by South Side Farm, White Bear, Minn. Born Dec. 1, 1899. Sired by Baron Pauline De Kol with 8 A. R. O. daughters, and tracing three times to De Kol 2d. Our bull's dam has A. R. O. record of over 22 pounds, under five years, and during week's official test milk averaged over 40 per cent. fat. Fine conformation, nicely marked, superior handler, large veins and rudimentaries, gentle, vigorous, and sure. Other bulls ready for service.

STAR FARM HOLSTEINS
SPECIAL OFFERING: Six of the choicest Johanna bull calves from official butter record dams and A. R. sire.
Also a few choice heifer calves, yearlings and 2-year olds; latter bred to Mercedes Julip's Pietertje Paul.

FOR SALE.
H.-F. Bulls, ready for service. from A. R. O. Cows and sired by Sir Jonanna DeKol, 25467 A. R. O. Butter record of dam, 24.03 lbs. at 4 years. Also Improved Large Yorkshire Pigs. C. A. SCHROEDER, West Bend, Wis

LOOK HERE

34 cows and heifers in the **McGEOCH HERD** have been **officially tested** with the following results: 10 cows average 20.26 lbs. butter in seven days; average per cent of fat 4.06. 7 four-year-olds average 16.82 lbs. butter in seven days; average per cent of butter fat 3.93. 9 three-year-olds average 15.06 lbs. of butter in seven days; average per cent of fat 3.50. 8 two-year-olds average 12.16 lbs. of butter in seven days; average per cent of fat 3.60. We have a few young bulls out of some of these cows, and sired by **Gem Pietertje Hengerveld Paul De Kol,** or **Sir Ormsby De Kol** for sale. One of these is out of a cow that made official record of 24.88 lbs. of butter in seven days; average per cent of fat 4.47. Are these the kind of **Holstein-Friesians** you wish? If so, can we not interest you in putting a bull from this class of stock at the head of your herd?
For particulars address **H. B. Daggett, Mgr., Station A, Milwaukee, Wis.** Residence: National Ave., near 40th. Phone, South 1601.

HOLSTEIN-FRIESIAN
YEARLING BULLS

ready for service, of high quality and breeding, at low prices for the next sixty days. They are from such families as Sadie Vale Concordia, Korndyke, De Kol Burke, Clothilde, Netherland, etc. Also choice heifers.
Smiths & Powell Co., Syracuse, N. Y.

The Dairy Cow.

[By Prof. C. L. Beach, Storrs, Conn., at the New Hampshire Dairymen's Convention, 1903.]

Fellow Dairymen:—It has been said that a good dairy region exists wherever there are intelligent dairymen to engage in the business. Success depends more upon the man than upon local conditions. Good dairy practice is not different in New Hampshire from what it is in Connecticut. Sound dairy knowledge is alike applicable to the New England, the Wisconsin, or the California dairyman. The acquired knowledge in regard to the breeding and selection of the cow, the sanitary construction of stables, the palatability and efficiency of rations, and many other problems are universal in their application. We have met here today to exchange experiences, confident that such an exchange will be mutually helpful.

The subject assigned me upon your program is "The Dairy Cow," but this subject should be qualified, for I purpose to speak only upon the selection of the dairy cow.

Statistics tell us the average cow of the United States produces about 3,000 pounds of milk per year, or an equivalent of 140 pounds of butter. This low production will scarcely pay for the cost of keep, certainly not under our New England conditions. There are many herds of grade cows, however, that produce 5,500 pounds of milk and 280 pounds of butter, or nearly twice as much as the average production.

A few years ago the writer made a canvass of a large number of herds whose owners patronized one of the large creameries in our state. From data collected in this canvass, an average production of butter per cow was estimated and is tabulated below.

Average annual production of butter per cow by the herds of the patrons of one Connecticut creamery.

No. of Herds	No. Cows in Herd.	Average Yield Lbs.
1	10	300
8	58	250 to 300
16	133	200 to 250
14	89	150 to 200
8	102	less than 150
47	392	199

The results of this canvass show that only one herd averaged more than 300 pounds of butter per cow per year, and only eight herds averaged from 250 to 300 pounds. The actual butter production per cow per year in the whole 47 herds of 392 cows, averaged 199 pounds. From the best data available it appears that the average conditions in New England require that a cow shall produce not less than 250 pounds of butter per annum before she can begin to yield a profit, when the cost of food, labor and other items are computed at the market prices. Yet the above canvass shows that only one-fifth of the cows included in the examination exceeded this amount, while the general average is fifty pounds below it. If these figures are taken as a fair index of the average production throughout New England, then it would seem that the dairy industry in this section is far less profitable than it ought to be.

It is not difficult to discover sufficient reason for such poor showing, locally and generally, on the part of Connecticut herds. Improper and irrational feeding and poor care and management are causes in a great many instances in which the quality of the cows might assure better results under different feeding and care. There are records of experiments in which herds of very ordinary cows, under proper care and feeding, have produced surprising amounts of milk and butter, and have yielded handsome profits. But a little careful study of dairy herds lead to the conclusion that no inconsiderable part of the trouble lies in keeping cows that no system of feeding, nor the best care and management, could ever make profitable, at least so far as the dairyman is concerned.

Individuality of the Cow.

The ability to utilize food and convert it profitably into milk and butter is a quality of cows that varies with individuals. The variation is in the amounts of milk and butter which different cows make from a given amount of food, and is spoken of as the individuality of the cow. Among both ordinary cows and cows of pure breeds the variation in this respect is quite remarkable, as illustrated to a marked degree in the study of the herd owned by the Connecticut Agricultural College that was made during the year 1898. According to this study the cow with the best record produced during the year 509 pounds of butter, at a profit of $42 82; while during the same time the cow with the poorest record produced 172 pounds of butter at a loss of $4.09. Even in a comparison of the five most profitable cows with the five least profitable, the differences are still remarkable. The former five cows produced butter at an average of 409 pounds per cow for the year, at an average profit of $31.29; while the latter five cows averaged 218 pounds each, at an average profit of 87 cents. Similar differences in the individual qualities of the different cows are observed in the comparison of the production of milk and butter. These variations in the amount of butter and milk produced by individual cows in this herd are not exceptional. The records of station herds and of hundreds of private herds, where individual records have been kept, show variations fully as great as these.

"Condensed record of the dairy herd of the Agricultural College for 1898, showing the value of the food consumed, and the amount and value of the milk and butter produced by each cow during the year, and the corresponding profit or loss.

Number.	Breed.	Years.	Cost of food for one year.	Profit. From butter at 18c per lb.	Profit. From milk at $1 per 100 lbs.	Butter. Amount produced in 1 year. 82.3% butter fat.	Butter. Cost of food for producing 1 lb.	Milk. Amount produced in one year.	Milk. Cost of food for producing 100 lbs.

	Average for the herd		$40 80	$15 51	$15 72	313	13.60	5653	.75½

The record, of an entire herd of this kind contains much that is interesting In the study of the results the attention is called at once to the range in productive capacity and profitableness of different cows. Comparison of the narrow range in the cost of food consumed per day with the wide range in the returns in milk and butter produced therefrom illustrates quite clearly the individual differences in cows in regard to economy of production.

It is plainly evident that success in dairying depends very much upon the productive capacity of the individual cows that make up the herd. Inasmuch as there are such wide variations in different cows, in regard to the amount and composition of milk they produce, it should also be evident that a very practicable way to improve the herd and increase the average productive capacity is to dispense with all the cows which the scales and the Babcock test together prove to be unprofitable. It would be pretty safe to assert that twenty cows selected in this way for their high and economical productive capacity would be more profitable than twenty-five and possibly even thirty cows selected in the ordinary random method of making up a herd.

Judging Dairy Cows.

Although the final proof of the value of any cow and her right to be kept in the herd should depend upon her ability, as shown by the scale and fat test, it very often happens that a dairyman must rely upon his own judgment in the selection of cows for his herd. The cow whose good records are known is not usually for sale. Even if the buyer had time to make a short test, that would not be sufficient to prove the worth of the cow. Usually he has to depend upon experience, and possibly in some cases careful study, in judging of the capacity of a cow for dairy performance from what he can observe in her form and from the general impression which she makes upon him. But the ability to judge a good cow under such circumstances is not common among dairymen. Thousands of dairymen have owned and handled cows nearly all their lives and yet are poor judges of cattle. The reason for this is that the knowledge which they have gained from their experience is superficial. They have made little or no study of the cow except in the aggregate They never have proved or corrected their judgments by records or tests. The type of a good dairy cow is a vague conception in their minds, based more upon personal opinion than upon evidence or fact.

Anatomical and Physiological Features of the Dairy Cow.

Intelligent and progressive farmers and dairymen, however, are becoming more familiar with the fact that milk and butter producing qualities of cows are accompanied by a general vigor, conformation, temperament, fineness, bearing and other features that are quite characteristic. Dairymen who profit most in the keeping of cows familiarize themselves with these characteristics and understand their relationship to capacity for production.

This is understood best by those who have had long experience with cows, and have studied under widely varying conditions their general form and manner, especially in connection with accurate records of performance. In general such knowledge includes some idea of anatomy and physiology of the cow, particularly with reference to the general locality, development and functions of the various organs concerned in the production of milk and butter.

In a discussion of this subject, the dairy cow may be considered as a complex machine, developed for a particular purpose, consisting of a frame work, of characteristic form, supporting parts that are most essential to the purpose and parts that are less essential—the essential parts being those directly concerned in the production of milk and butter, while the less essential parts are only indirectly concerned.

The following figure of cow No. 2 shows the outline and general features of a profitable cow of the dairy type, and illustrates points referred to in the following paragraphs.

In the opinion of the writer it seems justifiable to state that the general constitutional vigor of the cow is of primary importance, and that of nearly as great importance are efficient digestive organs; large and well formed milk organs; strong heart and good blood circulation; large, strong lungs; and a highly developed nerve system. For convenience in the present discussion these are called the essential organs, and are considered here with some remarks concerning their uses or functions.

Digestive Organs.

Milk is a manufactured article, produced by the cow from the food which she consumes. The capacity of a cow for producing milk depends largely upon her capacity for digesting food and assimilating it into her tissues. For the accomodation of a large and efficient digestive apparatus, a good dairy cow should have a long, deep and wide barrel with well sprung ribs. This form of middle piece gives ample room for the storage of food, and for an apparatus capable of disposing of large quantities of the coarse, bulky fodder which the cow consumes.

Milk Organs.

The milk organs are quite intimately

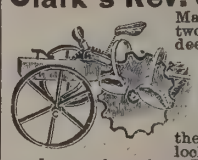
Clark's Tools for Large Hay Crops

CLARK'S REVERSIBLE

Bush Plow and Harrow

Cuts a track 5 ft. wide, 1 ft. deep. Connects the sub-soil water. It is an excellent machine for covering in sugar cane. Strength guaranteed. Can plow a newly cut forest, stump, bush or bog land, leaves the land true and clean for grain or any crop.

Clark's Dbl. Action Cutaway Harrow



Moves 15000 Tons of Earth a Day.

Clark's 8 foot Smoothing Harrow.

Will smooth an acre as true as a mill pond in twenty minutes.

Clark's Rev. Sulky Disk Plow

Made single or double. One or two furrows five to ten inches deep; 14 inches wide. For two or four horses. Light draft. No side draft. No similiar plow made. When Clark's grass tools are used as directed in his grass circular, we, the C. H. Co., guarantee them to kill wild mustard, charlock, hard hack, sunflower, milk weed, morning glory, Russian thistle or any other foul plant that grows, or money refunded. Now is the time to commence work for next year's seeding to grass.

Clark's Root Cutter.

TWO SIZES. Cuts 1 or 2 bushels per minute, for fowl or beast. Gouge cutters never choke or clog. Price $7 to $15.

The Fence That Lasts

Why do wire fences give way, break and sag? Go out and examine carefully the average wire fence and you will have no trouble in answering this question In all ready-made woven fences, the stays or uprights are made of smaller wire than the horizontals, consequently they give way sooner and ruin the whole fence.

Another reason that the wire fences sag and break is that proper allowance is not made for the expansion and contraction caused by changing weather. Both of these difficulties are entirely overcome in the famous Brown Fence.

The uprights are of the same size as the horizontal wires and the laterals are made from high carbon, hard springed coiled wire, which not only allows for all contraction and expansion due to change of temperature, but also relieves the posts of much of the dead pull upon them. It is an economical fence to build, and even if it cost more than others (which it does not) it would still be the cheapest in the end. Our readers are urged to send for the Brown Fence Book Address Brown Fence & Wire Co, Cleveland, Ohio. This company is headquarters not only for the Brown fencing but also for Coiled Spring Wire, smooth, soft Galvanized wire and Barb Wire, which they sell to the farmer direct from the factory at wholesale prices, guaranteeing both quality and price.

concerned in the productive capacity of the cow, as it is in these that the milk and butter fat are finally elaborated from the food. It is not altogether clearly understood how the milk is made in the gland, but it seems quite probable that it is produced by the epithelial cells within the udder. So far as is known, the quantity of milk that can be produced depends in a large part upon the number and activity of these cells. The number of such cells is limited by the size of the udder and the amount of fatty tissue it contains. The dairy cow should therefore have a large udder capacity, the larger the better, but the size of the udder should not be due to any large amount of fat or flesh. There should be an elasticity of the tissue, with a shrinkage of the udder when empty. The udder should have considerable surface, extending far forward and well up behind. It should be well balanced and symmetrical in shape, indicating good development in all quarters; for the more perfectly developed the organ is, the larger the amount of milk it will be likely to yield. It should be spread considerably from side to side, also, while the teats should be evenly and squarely placed. To make room for such a capacious, well developed udder, the hind legs of the cow should be wide apart, the thighs should be thin, and the flanks high arched.

The activity of the udder, or the amount of work done in it, is indicated to some extent by the quantity of blood that passes through it, which depends quite largely upon the capacity of the blood vessels which are connected therewith. It is important, therefore, that there should be a strong and full development of the arteries and veins of the udder and abdomen. The milk veins should be large and elastic, should extend well to the front, and should enter the abdomen through large or numerous orifices, thus permitting a strong flow of blood through them with a minimum of resistance as it returns to the heart. Besides these veins, there is a net work of them in the forequarters of the udder, and still others pass upward behind, which, when large, indicate considerable productive capacity.

Pelvic Organs.

Dairying is based upon the maternity of the cow. It is the mother function that arouses the milk organs into activity for the feeding of the offspring. Many generations of selection and breeding by man have prolonged the period of activity of these organs in the dairy cow, but the beginning is always a function of reproduction, which must occur with considerable regularity in profitable cows. In order that this may occur with least tax upon the general vigor and activity of the cow, she should have broad hips and a high pelvic arch, furnishing ample room for the young before birth, and providing for its easy delivery.

Heart and Lungs.

The chest should be deep, providing room for generous sized heart and lungs. These organs, vital in every animal, are required to do more than ordinary work in the dairy cow. The digestion of a large amount of food and its conversion into milk require an expenditure of energy and vitality equal to that expended in the performance of hard work. Therefore, there should be a vigorous circulation of blood and ample provision for its purification and for a large supply of oxygen.

The Nerve System.

The digestive tract prepares the food for assimilation into the tissues, the udder elaborates the milk, the heart forces the blood with its load of food and oxygen through the body, the lungs supply oxygen to the blood and remove from it the product of the oxidation which takes place in the body; but the brain and nerve system are concerned in all these operations. Through the influence of this system the activities of all the organs are aroused, guided, controlled, and harmonized. In the cow the heart and lungs are ever active. The digestion, absorption and assimilation of food, and perhaps the mysterious elaboration of milk, are constantly going on. Collier estimates that a cow giving an average quantity of milk produces, on an average, 138,210,000 fat globules per second, during each twenty-four hours. This and the secretion of the other constituents of the milk illustrate the amount of activity in the udder alone, and suggest the need of a highly developed nerve system. The more pronounced outward signs that indicate this nerve development are a bright, lively, and prominent eye, this prominence causing a dished face; a wide forehead; a wide junction of the skull and spinal column, indicating a large brain; a large prominent backbone, giving room for a well developed spinal cord; a long slim tail and considerable energy and vigor and style of action.

The Correlation of Parts.

It is to be observed that further help in the study of dairy cows is an understanding of the reciprocal relations between the different parts of the body. It is in accordance with this correlation that the parts of the body here spoken of as less essential may be said to be indirectly concerned in the production of milk; for the same food cannot be used at the same time for both forming flesh and producing milk; hence the smaller the amount of food used in the formation of tissues of these less essential parts, the larger the amount that will be left to be converted into milk.

Less Essential Parts.

The energy of the dairy cow is directed as completely as possible toward the production of milk and butter. The tendency to produce milk has been increased as much as possible by breeding, inheritance, and development; and likewise, the tendency to lay on flesh has been restrained. Thus the less essential parts of the dairy cow have been depleted, or have "paid tribute" to the parts which are more essential to the purpose for which she was bred. This has resulted in developing a cow with a fine, slender head and neck; light fore quarters with but little flesh; rear quarters thin, incurved at the rear and sides, showing but little flesh; sharp withers; spare crops; and a generally thin, bony, angular body, devoid of all unnecessary flesh.

The writer is aware that this idea of the special-purpose cow is opposed by advocates of the general-purpose cow, as well as by numerous breeders, owners, and experimenters. Correct conclusions as to the exact type of cow best adapted for large dairy performance can only be drawn after studying the records of many cows from the economic standpoint, and for full lactation periods. Even then there may be exceptions to the general conclusions arrived at. But the dairyman is seeking for the cow most profitable for his own particular purpose and will usually be guided by the general law of averages.

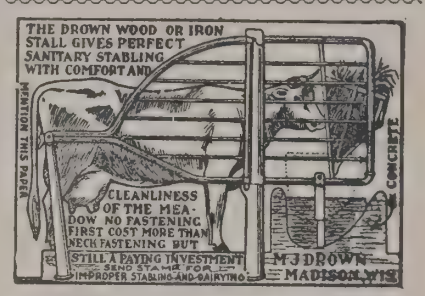
Comparative Study of Group of Dairy Cows, With Regard to Type and Economical Production.

The study of the individual cows indicated that, in this particular herd, the form and type of the cow is more reliable than breed alone as an indication of her productive capacity—grade cows of a distinctive dairy type surpassing thoroughbreds whose type indicated lack of dairy quality. In order to test the relation of form or type of cows to profitable production, we divided the whole herd into three groups, each cow in the herd being included in the group to the type of which she most nearly conforms. The divisions were based upon a study of the particular form of each cow, along the lines suggested by Prof. T. L. Haecker, in his study of the cost of production with the herd of the Minnesota Experiment Station.

The first group included the thin, spare, deep-bodied cows, and has been called the Dairy Group. The second group includes those carrying too much flesh, and is styled the Fleshy Group. The third group contains those lacking depth and width of the barrel, and are designated as Lacking Abdominal Capacity. The results of this grouping and combining the records of the several cows in each group may be summarized as follows:

No. 1. Dairy Group.

The cows in this group are spare, with deep bodies and well sprung ribs. The average production of the group is 351 pounds of butter, and 6,190 pounds of milk. The average food cost of each pound of butter is 12 cents and each 100 pounds of milk is 69 cents. They yield an average profit of $21 49 as butter cows, and $20.24 as milk producers. The cow chosen to represent this group is No. 2, Copper Queen, shown in the cut above.



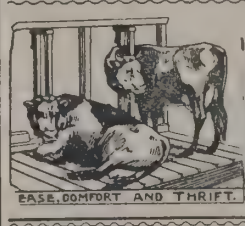
No. 2. Fleshy Group.

The cows in this group are large framed animals. The neck is thick, the shoulders heavy, the loin wide, withers round, crops full, brisket heavy, and as a class they are animals that take on flesh easily and look smooth and plump. They make an average of only 217 pounds of butter each, and less than 4,000 pounds of milk. When the labor expended in their care is taken into consideration, they are all kept at a loss. They charge in cost of food 18 1 cents, or 6 cents more than the dairy group, for each pound of butter, and 31 cents more for each 100 pounds of milk. The cow No. 24 is a representative of this group.

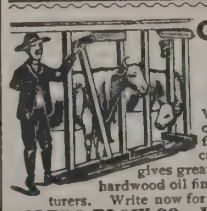
No. 3. Group Lacking Abdominal Capacity.

This group contains five cows lacking

GRINDS Ear Corn, Shelled Corn, Oats, Rye, Barley, Kaffir Corn, Etc., fine or coarse, for feed or family use. Has shake feed which insures regular and even work.
$27 to 45.
Don't Buy Until You Get our Catalogue.
BUHRS are made of white metal, so hard that neither file or tool will touch them. They will open and allow nails or other hard substances to pass through without breakage. We furnish this mill with or without crushers and elevators as ordered.
CAPACITY 10 to 45 bus. per hour, according to power used, kind of grain and fineness you grind. The only mill which grinds ear corn and all other grain successfully, with 2, 4 or 6 horse power.
SIZES. Made in 3 sizes for power up to 12 horse, and we guarantee it to grind more ear corn than any mill made with same power, because crushing and grinding plates are on separate shafts reducing friction.
OTHER STYLES. We have 41 styles and sizes of grinders, adapted to power wind mills, engines and horse powers of all sizes. We have powers of all kinds for driving all kinds of machinery.
CUT THIS AD OUT and send it to us and we will mail you free our Special Farm Machinery Catalogue. It illustrates and describes all these grinders and hundreds of other things for farm use
MARVIN SMITH CO., CHICAGO, ILL.



CHAIN-HANGING CATTLE STANCHION
The Most Practical CATTLE FASTENER ever invented. Manufactured and For sale by O. H. ROBERTSON, Forestville, Conn.



WARRINER'S CHAIN HANGING STANCHION. CLEAN, SAFE, COMFORTABLE.
MFG. BY W. B. CRUMB, Forestville, Conn.

WILDER'S PATENT SWING STANCHIONS
Chain or Pin Fastened.
Are self adjusting and noiseless. Fasten themselves open when animal is out; swing freely when latch is closed; opened and closed without removing mittens or gloves; keep cattle clean with most freedom of motion; blind bolted and cannot get loose in joints; made of best selected hardwood and furnished with chains or pins as desired
Safest, Strongest, Most Convenient
fastening made. Cheapest to put in and save room in barn. Send for Stanchion Catalog to
WILDER-STRONG IMPLEMENT CO., 11 Monroe, Mich.

Prescott's Swinging Swivel Stanchion
Keeps Cows Clean.
Swings forward while getting up or lying down. Looks back while standing Full particulars free.
E. PRESCOTT,
Beverly St., Boston, Mass

The BEST Cattle Fastening.
SMITH'S Self-Adjusting Swing Stanchion. The only PRACTICAL swing stanchion invented. Thousands in use. Illustrated circular free. GLENORA MFG. CO. Glenora, Yates county, N. Y.
Infringements will be prosecuted.

Only One Hand
needed to stanchion Cattle if you have our
Steel Latch Stanchion
When open is locked ready for cattle to come in; closed, it swings freely. Best dairy cattle tie because comfortable and quiet; gives greatest freedom. Made of selected hardwood oil finished. We are the sole manufacturers. Write now for circulars and delivered prices.
TOLEDO PLOW CO., Dept. H, TOLEDO, OHIO.

JUST OUT! UNDERHILL SELF ADJUSTING STALL

No Gutters
No Platforms
No fastenings
No Stables to clean
Cease trying to keep your cows clean. You can't do it. Give them a chance and they will do it themselves. This is the only way and the easy way Write for circular telling what the cow has discovered to us. It is a great revelation.
Wm M UNDERHILL, Oconto, Wis.

THE NEW PATENT
Cow Stall
AND FEED TROUGH.

This is the only Cow Stall with a centering hinge. Stalls all fold back to manger as the cows go out the barn. When ready for use, by starting one stall all come into position. No post at the gutter. Send for circulars.
R. A. McLERY & CO.,
Palmyra, Wis.

This Taylor Stanchion

is made of angle steel lined with hard wood on side next the animal's neck. It is lighter, neater and stronger than any other stanchion made. Swings on chains at top and bottom and admits of greatest freedom of motion. Cattle can lay with head on side. Easiest opened and closed. Reliable Agents Wanted. Write for special terms, prices, etc.
JAMES BOYLE, SALEM, O.

BIG SELLER FOR GOOD AGENTS
THE FOSTER STEEL STANCHION
Best cow fastener. All metal. Strong, durable and convenient. Liberal terms to hustling agents. Ask for circular No. 20
Frank H. Battles, Seed Grower Rochester, N.Y.

in depth and width of barrel. They consume a little less food than group 1, and yield considerably less profit in return, from both milk and butter. The cows in this group differ from those in group 1 in both form and disposition.. No. 18 in the group is a quarrelsome animal, and the boss of the herd. No. 19 is a very nervous cow, and uses her energy in unnecessary work. No. 20 is a discontented animal, always on the alert for an open gate, and often found where she ought not to be. As a group these cows are "light on their feet," and very active animals, which may account somewhat for their low production. They charge in food 14.9 cents for butter and 77 cents per 100 pounds for milk. They are not profitable animals, and should be weeded out of every dairy herd. The cow representing this group is No. 20.

The Result of Impure Water.

There is nothing quite so deceptive as the farm well, nor anything so fixed as the belief of a majority of farmers that the water from their well is the cleanest, sweetest and coolest of any on the face of the earth. Unfortunately, well water may be without taste or smell and still be dangerous. Smell and taste are very poor indicators of the quality of well water, and actually nothing but an outbreak of disease or an analysis will determine its safety. Every year sees an increase of population and a corresponding increase in the contamination of the water supply and in consequence shallow wells are becoming more and more dangerous.

Following is an experience that has come to only too many:

"I reckon, Joe, you won't say anything in the *Gazette* about having typhoid fever on lovely, perfect Woodlawn Farm?"

So remarked a sarcastic friend the other day. Would that I could say that it had never been! It was a terrible shock to me to come home from England and find no grandfather, no Andrew, no David at the station to meet me, and to know that they lay stricken with this foul and malignant disease. And to come to Woodlawn cottage and meet the wife at the door, worn with anxious watches, to enter the hushed and darkened rooms, to kneel by the bedside of my little ones and see their incredibly wasted forms and hear their weak voices hardly above whispers and to feel that the angel of death was hovering near, and if these precious forms grew much lighter they would be snatched swiftly away—all this was unspeakably terrible.

And yet we were spared the worst. Gradually the fever subsided, at last came the glad day when one boy sat up a few minutes, the glad day when they could eat a tiny bit, the glad day when their eyes grew brighter and they took an interest in what went on around them. Then I carried them each day out onto the lawn and they lay in the shade of the great oaks,and that was mighty good for them. And oh,joy! the day came when Andrew walked, and the next day David, who had been faithless, suddenly was seized with belief and before we knew it he was sprinting across the lawn like a young blue-jay, his thin legs moving stiffly and his faint impress hardly bending down the grass! And then Andrew was discovered hugging tight some rosy-cheeked apples. "You won't eat them, will you boy?" ,,N-o-o. I only want them to smell of!" And he did get a lot of comfort in that way, though it fairly brought the tears, the pathos of it, a boy hugging apples that he could only smell, and every fiber in him crying for food. It is all over now, we hope. They eat like wolves and are slowly gaining back their strength. And now comes the practical lesson:

How did this happen? I do not know yet. The well is driven, but it is only 28 feet deep. It is a curious fact that the road on which I live has had in the last ten years typhoid fever in nearly every house for six miles. Whence has it come? Scientists say from drinking impure water. Most of the wells at these homes are shallow dug wells. Only one or two cases are from driven wells. These people might have drunk away from home. What have I done that has been wrong?

I have had the water analyzed, but it takes so long to report that I do not know yet. We are carrying water from a distant spring in the meantime and expect to drill a new and much deeper well, tapping a lower vein. I think our sink drain a bad one. We will make it of metal instead of tile and carry it quite a distance away. There is a wooden floor under the pump. Beneath this floor water drips and it gets rather unclean. This shall be replaced with cement. The closet is a dry-earth affair and we shall use quantities of air-slaked lime as a disinfectant. Soon as I can afford it we shall abandon it altogether and put in water works, bath room, water closets, and carry the drain a good way off. Unless carefully managed this water closet will be more dangerous than the present dry earth closet. All this will cost money—almost as much as the doctor's bill and the nurse's. But it will not have to be done over again, and the doctor and nurse may be needed again, if we do not take care.

I write this to stir up some who have not yet had typhoid. They may by investing a very little money and labor save ten times the amount in cost of sickness, to say nothing of the sorrow. If one can not do more he can drill a well, and preferably a deep one. If he can not afford a sanitary water closet with drainage carried afar off he can build an absolutely safe earth closet. It should have a cement floor, concave, so that absolutely no drainage from it to the soil beneath could take place. Then there should be a capacious bin in the closet filled with dry earth and slaked lime, or coal ashes and lime. Never mind if the lime does destroy the value of the night soil You can keep it entirely odorless and safe and it is quickly and without offense removed at intervals with a shovel and carried off.

Permit no slops to be poured there. Never pour slops twice on the same ground. Get it firmly into your head that typhoid is not a "dispensation of Providence," but a foul disease carried by drinking impure water. This water must be polluted by human excrement and must carry organic matter to nourish the germs. Seven years ago my brother and sister had the disease at the home place; my sister never recovered fully, but died from the effects; my brother took four years of ranch life to make him the man he was before. Then we moved and made sanitary the earth closet, moved the garden and made it into a lawn and there has been no sickness since. That well has thousands of barrels pumped out of It every year by wind power; it is practically a spring.

Yes, I own to having typhoid, and plead guilty of the blackest crime a man can commit, being careless of the well being of my children. I plead simple ignorance in extenuation, and so are you ignorant, friend, and this is to warn you. —JOSEPH E. WING, in *Breeder's Gazette.*

Prosecution for Selling Adulterated Milk in Wisconsin.

ED. HOARD'S DAIRYMAN:-It may be of interest to your Wisconsin readers to be informed that during the past six months about thirty legal prosecutions have been instituted against persons for violation of the law by furnishing adulterated milk. In all but two of these cases convictions have been secured and fines of twenty-five to fifty-five dollars and costs have been imposed. Some of these convictions were for watering milk, others for skimming and a number were for the use of formaldehyde. Some of these convicted for the use of formaldehyde were furnishing milk in cities and others to cheese factories. Some months ago a prominent cheese dealer and cheese factory owner in this state was fined fifty dollars and

How she raised the Mortgage

MRS. L. R. TRYON
lives in a small town in southern Connecticut. She writes:

'Each year for seven years we tried to pay off a little of the mortgage on our home but almost every time we got a little put by sickness or something else seemed to eat it up. I had earned pin-money through The Ladies' Home Journal and The Saturday Evening Post and thought of the same plan to help pay the mortgage. The prize money for the summer's work, together with the commissions, will pay the last installment next month, all done by myself in odd hours during about a year and a half."

Thousands are earning money by this plan. Anybody can do the same.
Besides paying liberally for every subscription secured we are giving

$50,000
in Extra Cash Prizes

Each month $5000 will be given to **325 persons** who do the best work that month and, at the end of the season, **$10,000** more to the **451 persons** who have done the best work during the whole time. Everything necessary sent on request.

THE CURTIS PUBLISHING COMPANY
615 Arch Street
Philadelphia, Pennsylvania

Buy You a Ticket to CROOKSTON, MINN., and call upon
The Polk County Land & Loan Company

For Choice Red River Valley Farms. They pay railroad expenses if you buy from them. A few good bargains.

360 acre farm, 4½ miles from Crookston, Minn., a city of 7,000 inhabitants, and 2½ miles from the State Experimental Farm. This is a photograph of the buildings as they are today: House is 16x24 1½ stories with an L 14x22, and a wood shed in connection 20 feet square, all on a brick foundation. Barn 28x48, with a lean to 16x48, sheeted both inside and out. Two granaries, one 14x80, and the other 14x42. The buildings are all well painted and in very good repair, and has a fine artesian well. Every acre of this farm is under a high state of cultivation, and is well drained by a slight ravine running through the farm merely sufficient for self drainage. The soil is a rich, deep black loam with a clay sub-soil, and in every respect is considered to be one of the best farms in that vicinity. Our price on this farm is $35.00 per acre.

This is a **320** acre farm about 2½ miles south of the city, this farm is quite well improved, has a very good house of about seven rooms, 1½ stories, barn large enough for ten head of horses, also a good granary, pasture and an artesian well, also has a good well at the house, good grove around the building. This is a very choice piece of land for the price $32.50.

160 acres north-east of the city; this is all hay land, and located in a German settlement, the surrounding country is nearly all under cultivation; we consider this a good piece of land for an investment, this could all be put under the plow, if desired. Price $19.00 per acrs.

FARMING!

Is a sure thing in the district in Minnesota between St. Paul and Minneapolis and Duluth and Superior because there is a market at good prices for everything the farmer produces. This is the greatest natural grass district in the west and splendidly adapted to dairying, stock raising, as well as the growing of small fruits and vegetables. Four great cities within 75 miles. Same grade of clay land in Southern and South Central Wisconsin from $50 to $80 per acre. Our prices from $7 to $15 on 10 years time. This is the time for laboring men or men on salaries who want to be independent to get 40, 80, or 160 acres well located and make a start. Write for illustrated book and map to largest owners of Central-Eastern Minnesota lands.

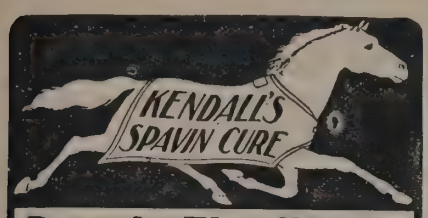
FINE FARM

FOR DAIRYING OR STOCK RAISING



In the Republican Valley. B. & M. road runs through land. 400 acres all good alfalfa land, 125 acres pasture, with two living streams fed by springs that are never dry. Republican River within ten rods of land. 30 acres ash timber; land fenced and has two sets of buildings. Winter wheat and corn crop about perfect this year. Price $30 per acre, one-third cash, balance long time.
B. G. CARY, Republican, Neb.

ILLUSTRATION.

CORN AND COMMON SENSE.

The Janney way of handling a corn crop is the common sense way, because in addition to husking the corn perfectly it shreds the fodder into "corn hay" for feeding stock or selling, thus saving the entire crop. The Janney Common Sense Corn Husker and Fodder Shredder has been eight years in the field and easily leads all other machines of the kind and number in use as well as in quality of work. It yields an additional profit over the old way, and soon pays for itself by the saving. If you are not familiar with the advantages of owning a Janney Common Sense Corn Husker and Fodder Shredder, ask the nearest agent or send direct to Janney Mfg. Co., Dept D, Ottumwa, Iowa, for husker Catalogue and full particulars.

costs for selling skimmed milk" cheese, contrary to law. We have evidence of other violations of the law and prosecutions are to be instituted as fast as the force at the command of this commission renders it possible.

It has been a peculiar experience and has given me a new notion of the possibilities of human nature, to observe the weak and silly sympathy expressed in certain neighborhoods for these law breakers and to notice in some instances the pettifogging in the local press to free them from the odium justly brought upon them by their action.

Our regret is that the force of this commission is not sufficiently large to enforce the law so completely that not even one guilty person could escape.

J. Q. EMERY, Commissioner

Madison, Wis.

VETERINARY.

Queries in this department answered by DR. A. H. HARTWIG, Watertown, Wis.

Heifer Gives No Milk.

I have a heifer just come in first calf, she has not given any milk. I have had a veterinary treat her. He can do nothing for her. She has had no grain. She is a registered Guernsey. Would you advise keeping and try again? G. W. W.

Saugerties, N. Y.

ANSWER.

When the heifer comes fresh again, care must be taken to induce the udder to secrete milk by applying hand rubbing to the udder a week or two before calving time. You may also apply dilute alcohol after rubbing.

Unknown Disease.

I have a two-year old heifer that dropped a calf Sept. 28, 1903, and for two weeks did finely; then began to break out on back part of udder, a raised blotch as large as a dime down to a speck, and has now extended all over her body, clear down to her feet, dry and hard. One over end of teat makes it necessary to draw the milk with a tube; is gradually drying up; does not seem to be much sore; stands perfectly to be milked; has had a large bunch in flank as large as a turkey's egg, seems to be loose under skin. W. E. T.

Lynn, Susq. Co., Pa.

ANSWER.

Your case requires a personal examination as it is something unusual. Employ a qualified veterinarian.

Texas Fever Perhaps.

My cows are sick; I don't know whether it is red water or tick fever. They don't seem to be in any particular pain; they won't eat or drink and when they walk seem weak in the hind quarters. The water is red, sometimes nearly black; stay in that condition 2 to 3 days and die. G. C. S.

Monroe, Ga.

ANSWER.

Your description would indicate Texas fever as far as it goes, but there is not enough of the description to warrant the writer to arrive at a positive conclusion. The safer way would be to employ a qualified veterinarian and have him make a personal investigation, both of the living and the dead animals. If you have no such veterinarian in your vicinity, write again and mention every detail of the trouble, note everything unusual, and we will try to advise more definitely.

Barrenness.

I have a grade Guernsey cow now 5 years old. She dropped her first and only calf before she was 2 years old and is still giving about 4 quarts of milk, but all efforts to get her with calf have failed, I have owned her about a year, but the foot and mouth embargo prevented my sending her to bull until 7 weeks ago; she took the bull all right and past the first time (3 wks.)all right, but at the end of 6 weeks came in heat again. F. H. S.

Framingham, Mass.

ANSWER.

This is usually the result of an abnormal condition of the female organs of generation. If possible have these examined and ascertain the cause. Sometimes the animal is too fat to breed, and often a mere change of bulls will remedy the trouble.

Horse Owners! Use GOMBAULT'S Caustic Balsam

A Safe Speedy and Positive Cure

OLIVER B. WOOD,

Printer and Stationer,

No. 50 Foster Street

Worcester, Mass. June 11, 1903.

I have a Wilkes Pacing Gelding that became lame in the off forward foot. The soreness was just above the hoof, with a tendency to throw out a ringbone. I tried three veterinarians and various advertised remedies which were on the market but without effecting a cure. Also fired and blistered him once. My attention was called to your remedy by a friend who urged me to use it. After one month's trial and the use of one and one-half bottles, we hitched the horse up and drove him and he has never taken a lame step since. Have now been driving him six months on the road, have speeded him on the track and macadam roads and he is as sound as a bullet. It is certainly a wonderful remedy and I feel that I cannot say too much in its praise. Wishing you every success, I am yours respectfully

O. B. Wood

J. H. DAY LEADING DRUGGIST

Dayton, Wash., Sept. 15. 1903.

Troy Chemical Co.

Troy, N.Y.

Gentlemen:-Herewith please find enclosed M.O. Exchange for which please send me at once 1 bot. "Save-the-Horse"

"Save-the-Horse" is certainly accomplishing wonderful results in this case. The bog is all gone and the Thoroughpin is fast disappearing.

Very truly yours J. H. Day

RIPON, WIS., July 29, 1903. Gentlemen: My horse had ringbone on right hind leg. Used blisters for nearly one year and had him fired, but to no effect other than to leave a bad scar. In April I purchased a bottle of your "Save-the-Horse" and by the time I used half of the bottle it had completely cured the lameness and is reducing the bone. Yours respectfully,

E. B. Dakin

It is the truth---actual results from business men whose standing and reliability can be readily ascertained--- which have made "Save-the-Horse" such a success. Their cured horses are living advertisements, absolute certainties as to the possibility of the remedy in your own case, and with every bottle is a guarantee document as binding to protect you as the best legal talent could make it.

"Save-the-Horse" cures without scar, blemish or loss of hair, can apply at any time, any place, and in all conditions and extremes of weather. Horses may be worked as usual with shin or ankle boots, as no harm can result from destruction of hair or scalding of limb. **Positively and Permanently Cures Bone and Bog Spavin, Thoroughpin, Ringbone,** except low ringbone, **Curb, Splint, Capped Hock, Windpuff, Shoe Boil, Weak and Sprained Tendons and all Lameness. $5.00 per Bottle.** Written guarantee with every bottle given under our seal and signature, constructed solely to satisfy and protect you fully. Need of second bottle is almost improbable, except in rarest of cases. Send for booklet and copy of guarantee. $5.00 per bottle at all druggists and dealers, or sent express prepaid.

TROY CHEMICAL CO., TROY, N. Y., Also Manufacturers of Veterinary Pixine.

Magnitude of World's Fair Prizes.

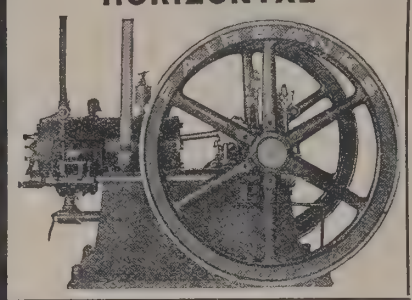
That the cash prizes offered in the live stock department of the Louisiana Purchase Exposition aggregate almost thirty per cent more than the total premiums of twelve leading state fairs and the International and American Royal shows combined, might reasonably be doubted by experts in such matters, but such is the case. The cash prizes in Chief Coburn's department of the World's Fair are $55,300 greater than those offered by the fourteen largest live stock shows of the United States in 1092.

This interesting comparison was made at the recent meeting of the American Association of Live Stock Herd Book Secretaries, in a paper on "Live Stock Exhibits at the World's Fair," read by Hon. Geo. W. Stubblefield. Mr. Stubblefield took for comparison the amounts of money offered in 1902 by the state fairs of Illinois, Indiana, Iowa, Kentucky, Michigan, Minnesota, Missouri, Nebraska, New York, Ohio, Texas and Wisconsin, and of the International Exposition at Chicago and the American Royal show at Kansas City. The total live stock offerings of these fourteen great shows, compared with those of the World's Fair at St. Louis, read as follows:

	State Fairs.	World's Fair.	Difference.
Horses	$49,488.00	$93,640	$44,152.00
Cattle	84,623.50	64,030	-20,593.50
Sheep	23,906.50	45,500	21,593.50
Swine	24,477.00	32,186	7,709.00
Poultry and pigeons	13,329.85	15,770	2,440.15
Totals	$195,824.85	$251,126	$55,301.15

These figures give at a glance a view of the magnitude of the World's Fair live stock prizes. The differences shown above are in favor of the World's Fair except for cattle, for which the aggregate of the fourteen shows is the larger. The sums allotted to the dog, cat and pet stock shows at the World's Fair are not included in the foregoing.

The "Penny Wise and Pound Foolish"



Policy has an apt illustration in the man who buys a **CHEAP** gas or gasoline engine. Unreliable service, frequent and expensive repairs, wastefulness in fuel and short life offset many times over, the small saving in first cost. The **"OTTO"** is the original and **BEST.** Suppose it does cost a little more money, the extra dollars are well invested. **70000** users throughout the civilized world support us in this claim.

A Peep Into a French Farm Dairy.

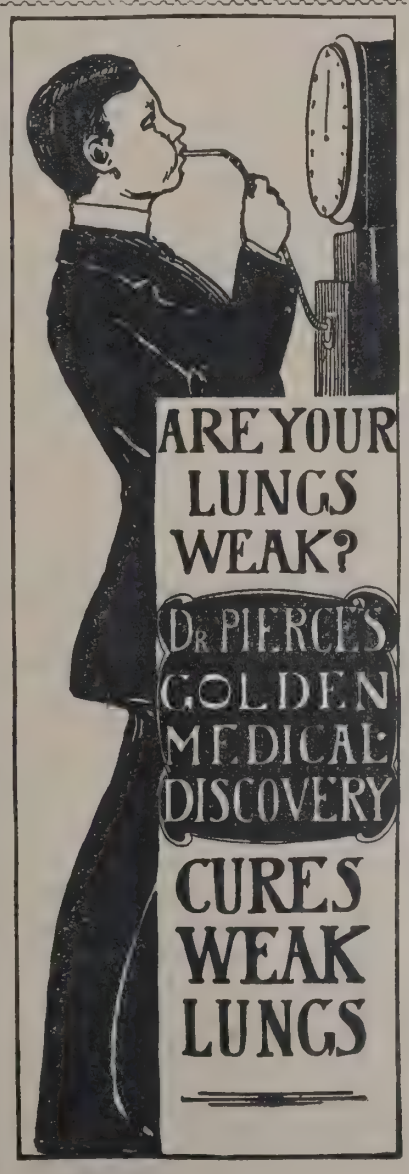
A recent issue of the *Scottish Farmer* contains a racy description of a visit made by a lady correspondent to a French farm when churning was going on:

One fine evening Monsieur Y—— and I, out for a bicycle ride, pass a farmhouse in the middle of a field. It has a square garden in front facing the road, and at the side and back a court-yard floored with clayey soil and hemmed in with roughly put up rails. Within the court-yard the farmer and his man are busily engaged in churning, whilst Madame —— walks around superintending their operations. "Would you enter?" says Monsieur Y——. "Yes, I should like to very much," says I, and he waves his arms to the people round the churn. Immediately a small boy comes running to the road gate to unlock it for us (the farm gates are all locked to keep out the many beggars who infest the district), and we pass in and around the house to see the churn. Madame, short, strong-looking, and suntanned, receives us graciously, shaking hands and talking volubly. We wish to see the butter? Oh, certainly we may, if we care to wait, but it will not be ready to make for at least an hour. The churning has lasted but one hour yet, and there is much cream in today, and she lifts the lid of the churn to let us have a peep.

The cream is thick and clinging in one mass of tiny bubbles, and as I look into the churn I am amazed to see that it is filled to within a foot of the bung hole. The churn is a large, horizontal, barrel one, and may be used either as a revolving barrel or as a still barrel with revolving dashers. "In hot weather," says Madame, "we turn the barrel, in cold we turn the dashers." She goes on to tell me, in answer to my questions, that the churn will hold over 250 quarts, and 150 lb. of butter may be churned in it easily. I say to myself, mentally, if it were my churn, it should never be used for more than 90 lb. of butter—120 quarts of cream. But, then, I should never expect our men folk to churn more than 40 minutes.

Madame does not possess a thermometer, and never regulates temperature, beyond keeping the dairy warm in cold weather by means of a small charcoal portable stove, and churning in the cool morning or evening in summer. Some people in Normandy do use a thermometer, but she has never bothered. While we talk, the daughter of the house, tall and straight, with black eyes and wavy hair, walks to and fro washing up milk pots—terreens of rough, hard earthenware—in which the milk has been set two days for creaming. There are 13 of these, all in a row, set on a wooden board to keep them off the ground. At one side of the court-yard is a large, portable zinc boiler, with a little stove under it, and at another side, conveniently near, a pump with a large tub set under it. Madamoiselle walks to the side of the field and picks a good bunch of nettle tops. After crushing these in her apron she drops them into some warm water, lifted from the boiler into a terreen, then grasping them firmly scrubs round the latter thoroughly. The terreens seem to have been rinsed with cold water before my arrival upon the scene.

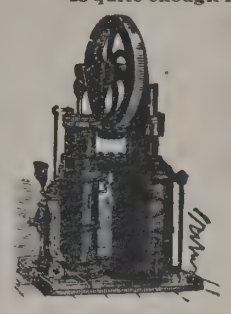
All that they ge,t after scrubbing with this one lotof warm water, is a good rinssing in clean, cold water in the tub, under the pump. Having given them this, Madamoiselle ranges them, tilted against the house wall, upside down on a rail, which is fixed along about 15 inches from the wall. Madame, entering the dairy at this stage, I am attracted to see what she is doing. She opens the window and a faint cloud of smoke comes out through it. Wondering at this, I am delighted to be invited to enter and see the cause. The dairy is small, and fitted with shelves for milk pots all around—many milk pots stand on the floor also—and near some of these latter, is a small portable stove, which has been lit to-day to keep up the temperature; these cold east winds take so much heat out of the air, and discourage germ life, so that the milk does not sour readily, without some assistance from the heat of the stove.



The churning still continues, and there is no sign of butter, so Madame lets us wander round the farm and see the stock, while she crams with pellets of barley meal and buttermilk, ten fowls being fattened for market. The farm consists of 42 acres of good, but marshy land. There are 13 cows in milk (and one not milking) in a field seven minutes walk from the house, and two light horses in another field. Then nearer home 5 or 6 adult turkeys, 50 young ones, of about six weeks, and 10 just hatched, two fattening pigs, and two younger ones to be fattened later, four or five calves and a mixed lot of fowls to the number of about 60. The five calves of about six weeks old, look hungrily up as we inspect them. They are tied up in the corners of their square house, and when I asked Madame if she ever loses calves, she nods her head sorrowully and says yes, about every year some—two have died this year. "What was wrong with them?" "Oh some malade," and she lifts her shoulders and spreads her hands, to indicate that she knows not what it was. They were very bad and died.

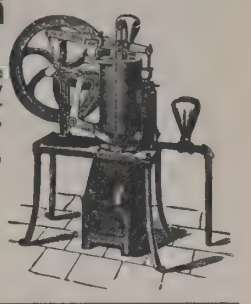
I regret not having enough French to inquire if the "malade" was white scours, and to recommend a dose of castor oil first, and afterwards two or three doses, consisting of a third of a small bottle of "gaseous fluid," at intervals, as a remedy, for I know a place where many calves have been tided over an attack of this nasty complaint by those means.

As we approach the house we see that at last the butter has come, and the master is drawing the buttermilk into large wooden pails. He has churned nearly three hours, and during our absence has been obliged to take some of the cream out, because the churn was too full. Now the butter is in a great yellow lump, resting on the dashers as the buttermilk gradually disappears below. Quickly, when all the buttermilk has been drawn, this butter is worked by the dashers in four lots of water successively, each lot consisting of about 50 quarts.



In each water the dashers are turned about a minute fairly quickly, so that the butter may be well squeezed and broken against the side of the churn, and the last water is quite clear when the washing is done. Whilst this has been going on, Madame, taking a terreen (pot) from the rail and a bunch of nettles from the fence, has well scrubbed the former with wood ashes and rinsed it with clean water, and also she has brought out from the house a small wooden table and spread over it a very fine, wet, linen cloth.

Now she stands by the churn with her right hand ready to lift the butter out. But first we must all taste it and pass our opinion on it, so Mademoiselle rushes for the loaf that we may have a small "thumb piece" each. The flavor is very



HALF ENOUGH WATER

Is quite enough for some people, but most people want water every day. If

good, but I can detect a slight indication of the butter having been rubbed, which is not surprising, under the circumstances. Color also is good, but the consistency is inclined too much to greasiness.

Madame lifts some butter into the prepared pot with her right hand, and this is the only stage at which it is touched by hand. Having carried it to the table, she takes a small flat spoon of boxwood, and lifting the butter in spoonfuls on to the linen, pressing and flattening each bit, she piles it in a round heap. When about half the butter from the churn has been thus piled it begins to dawn on me that it is to be moulded to a special shape with that spoon, for Madame smooths the sides most carefully and presses them in to taper towards the bottom. Finally, when she has done, there is a large mass of butter (about 130 lbs., an extra large churning this week, evidently) of the exact shape of the large, strong hamper in which it is to be carried to market; broad and raised on top, tapering towards the bottom; smooth, without a crease in all its surface, it has here and there a drop of clear water trickling down its sides.

The linen cloth is next wrapped round the sides and folded over the top, and the mass of butter dropped into the hamper. Tomorrow it is to be conveyed to the market, eight miles off, and sold to a factory owner, who will pay for it and grade it according to its quality, then work it up at his factory with blender and butter-worker, washing it again with a shower bath of water as it is being worked, and adding dry salt to it. Finally, he will divide it into small packages of 20 to 30 lbs., pack it in grease-proof paper in beautiful, clean-looking white willow hampers, and perhaps export it to England.

It is ten days since the events described above occurred, and Madame having kindly given me a piece of butter to take home with me, I have kept part of it until now. Though it has not a speck of salt in it, it is as pleasant to-day in flavor as on the day it was made. I thought it better at the end of the week than on the day of making. This week the churning only took an hour and a half. No doubt the fact that the men have to churn so much cream at a time lessens the friction applied by long churning, and hinders the speed of churning from ever being high. Otherwise such work would be disastrous to the quality of the butter.

Washington State Dairymen's Meeting.

ED. HOARD'S DAIRYMAN:—The Washington State Fair which is yearly held at North Yakima, Wash., has just closed it meeting with good success in all its departments. During fair week the President of the State Dairy Association, Hon. H. L. Blanchard and the board of directors met at the beautiful home of the Secretary, Mrs. E. Carmichael, where they with a number of other prominent people partook of a splendid banquet, followed by music and singing.

The board of directors decided to hold the meeting of the Washington State Dairymen at North Yakima, Wash., on December 29, 30 and 31st. A strong effort will be made to get prominent men from abroad to make addresses and others to prepare essays. No pains will be spared to make this one of the best meetings ever held in the state, An attractive and snappy program will be prepared. Let every dairyman who reads HOARD'S DAIRYMAN in the state of Washington, remember the date and come to this meeting and listen to good dairy gospel from some of the best dairy students that can be procured.

North Yakima, Wash. E. F. R.

THE BREAK DOWN

Is usually in the wheel. They receive the strain and wear. They dry out, spokes and feloes rot, tires come loose. Get the service out of wheels you do out of gears by using

Electric Metal Wheels.

You have a wagon for a life time. Electrics are the staunchest, tightest, easiest running wheels made. Straight or staggered oval steel spokes, cast in the hub, hot riveted in tire. Broad tires, no rutting, light draft, any height, fit any wagon.

We make a specialty of long range sales, so no matter how far away you live, if interested write us. We refund railway fare to parties who buy of us Send for price list with pictures of farms.
THE JOHN M. CANNON LAND AGENCY, CRESCO, IOWA.

21 STRONG REASONS

WHY IT WILL PAY YOU TO BUY A FARM IN THE GREAT BLUE GRASS COUNTRY OF NORTHERN WISCONSIN.

1. The soil is rich and productive. Everywhere there is a clay subsoil to retain the moisture.
2. The climate is very uniform—neither extreme of heat or cold.
3. The seasons are regular and there is never a crop failure.
4. There is an abundance of wood for building and fuel, which need only to be cut.
5. Taxes are very low compared with other sections.
6. It is the best agricultural country known for a man of small means to get rich.
7. It is better to own a low-priced farm than to owe for a high-priced farm.
8. You can own a home in this section for what you now pay out for rent in one year.
9. Everything grown in the west can be grown on these lands.
10. There is an unsurpassed market for all farm products throughout the year.
11. Truck farming is very profitable in this section.
12. No better fruit country in the northwest. All northern varieties are wonderfully successful.
13. The best place in America to raise horses, mules, cattle, sheep and hogs.
14. The water supply is the best. The country is full of clear running streams and springs
15. Cereal crops average more bushels per acre than in other northern states. This may be said particularly as to oats, the average yield being from 60 to 80 bushels per acre.
16. Grasses and clovers for grazing or hay grow luxuriantly, far better than they do in southern Wisconsin, Iowa, Minnesota, or the Dakotas.
17. No swamps in this section—no malaria, no chills, no fever, no cyclones, no hail or destructive storms.
18. Fish and game in abundance. It is the sportman's paradise.
19. Lumbering and manufacturing interests offer ample employment at good wages whenever desired, both winter and summer.
20. Thousands of settlers are moving into northern Wisconsin, and in consequence land is increasing in value very fast.
21. The best class of people are among the settlers, which include principally Americans, Germans and Scandinavians.

DON'T PAY RENT, but come up and let us sell you a farm which will cost you but little more than the rent of a good farm in the older agriculturial districts. Not only that, but a farm that will grow in value every day. Write us to-day for full particulars concerning these lands, and arrange to look them over at the earliest possible moment. They cannot fail to interest you if you want to get a home of your own. Mention HOARD'S DAIRYMAN.
WISCONSIN BLUE GRASS LAND CO., Baldwin, Wis.

DO YOU WANT 10 COWS?

We make the following liberal offer to any reliable farmer who buys 160 acres of land of us: We will furnish you with 10 cows, either fresh or soon to become fresh. They cost you just the market price. You sell their cream to the creamery. Every month you have the Creamery Company send us sixty per cent. of the amount due you for cream. You do this until the cows are paid for. In one year the cows with their increase will pay for themselves. After the first year they will take care of the annual payments of principal and interest due on your farm. If you buy a half section, we will furnish you with 20 cows, and so on, selling you 10 cows for every 160 acres you buy. This is the "crop payment plan" applied to stock. We expect purchasers to pay from $2.00 to $3.00 per acre in cash—sometimes we make easier terms to good men. If our plan interests you, write us.
WHITNEY & WHEELOCK, 22 Broadway, Fargo, N. D.

A RARE CHANCE
FOR A GOOD DAIRY FARMER

A farm of 465 acres will be sold cheap and on easy terms to right party. Farm is located at Waucota, Goodhue county, Minn., on river division of the Milwaukee road. East line of farm Lake Pepin. West line the railroad. Station within a hundred yards of buildings. Waucota is less than 50 miles from St. Paul and Minneapolis. Farm has 300 acres under plow, 100 acres pasture, balance timber. Barns for 40 cows, horse barn, granary, buildings for small stock, etc. House, 8 rooms. A rare chance for either a butter maker or one desiring to ship milk to the Twin Cities. For further particulars address
J. NEWTON NIND, Kimball Building, Chicago, Ill.

Wisconsin

offers unexcelled opportunities for those who want to stop paying rent and make money in agriculture, in the fruit or dairy industry, or in sheep raising. Along the lines of the

Chicago, Milwaukee & St. Paul Railway

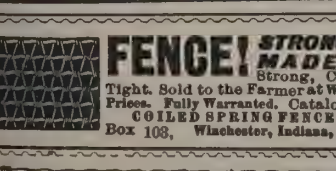
in Northern Wisconsin are many tracts of land admirably adapted to the home-seeker. In former timber tracts are many cultivated farms worth $50 to $75 an acre. Adjoining them, enjoying the same advantages, are unimproved farms for $7 to $20 per acre. Why not take a trip there and investigate these openings for yourself?

Additional information on request.

F. A. MILLER, GENERAL PASSENGER AGENT, CHICAGO.

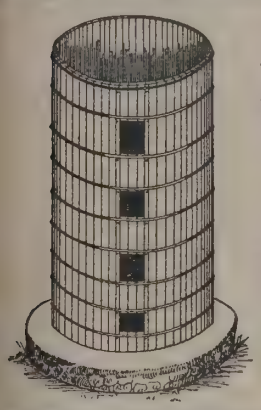
Prairie or Prairie and Timber Mixed

JUST WHAT YOU HAVE BEEN LOOKING FOR



We have such lands in Red Lake County, Minn. This is no wild region but a well settled country where you will see as fine improved farms as where you are, and you can get unimproved land within a few miles of up-to-date towns at

$12.00 TO $16.00 PER ACRE



Small payments down, balance in nine years, 6 per cent. interest. Excellent roads, good schools, and plenty creameries and cheese factories. If you don't want to pull stumps come to Red Lake County.

If you want a farm with a nice grove around the house, come to Red Lake County. You will find there just what you want. For Free Maps, Railroad Rates, Etc., write to
L. B. ARNOLD, 838 Pioneer Press Bldg., St. Paul, Minn.

COLONIAL BUTTER SALT

(Light, Flaky Grain)

LIBERTY BUTTER SALT

(Granulated, Uniform Grain)

"Money Makers for Butter Makers"

FLAVOR—PERFECT
COLOR—PURE WHITE

Purity—very highest, over 99 per cent pure salt.

Driest and Lightest Salts on Earth, thus retaining the moisture in the butter that would otherwise be worked out.

You don't know—you CAN'T know—what a difference these salts will make in the quality, weight, and value of your butter until you have tried them. Don't care what other salt you think is best you must try our brand before you find perfection.

FREE TRIAL. Write us for free 56 lb. trial sack of either or both, "Colonial" or "Liberty" brands. We will gladly deliver it to creameries and cheese factories only free of all cost. Try it, and write us honestly just how it works compared with the salt you have been using for the best.

COLONIAL SALT COMPANY, AKRON, OHIO.

CHICAGO OFFICE.....84 ADAMS STREET

Grit

Grit is a good thing in its place, but a bad thing in butter. Gritty salt—salt that's icy, insoluble, full of lime, chlorides and magnesium, is accountable for many exasperating difficulties of dairymen. It represents a loss of time, labor, money and patience, not always attributed to it. With DIAMOND CRYSTAL SALT—"*the Salt that's ALL Salt*"—your butter difficulties will disappear, and a gain in time, *money* and less labor result. Its dry, pure flakes dissolve quickly, imparting a rich flavor and keeping quality that find ready favor and highest market prices. "Just Salt" is a valuable booklet every dairyman should read. We send it free.

DIAMOND CRYSTAL SALT CO., ST. CLAIR, MICH.

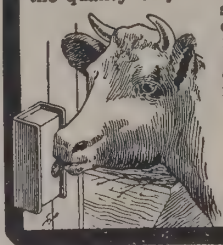
BUTTER FOR UNCLE SAM

THE CONTINENTAL CREAMERY COMPANY
TOPEKA, KANSAS

Has been awarded the contract to supply the United States Navy with half a million pounds of butter for the ensuing year.

For this purpose only the best quality of butter is used, and its keeping quality must be made of the very best, owing to the fact that the entire year's supply must be made within a few months and it is carried through all conditions of climate.

The government has made a thorough study of supplying butter to suit the requirements of the Navy and as a result it has laid down some very exacting standards to which those who bid for these contracts must comply. One of the few concerns who can fulfill these requirements is the Continental Creamery Co. and it was awarded this contract, which is the biggest single order for butter ever filled.



This company produces the greatest quantity of fancy creamery butter in the world, all of which is made from pasteurized cream. Surely it knows something about making good butter. It also knows from actual experience and the investigations of its chemists, that one of the factors in making good butter is

WORCESTER SALT--IT USES NO OTHER

A SCARED DAIRYMAN.

CHAPTER I.

It was a scared dairyman who said "Take away that bucket bowl separator." An agent for one of the many antiquated bucket bowl machines had tried to sell him one. Just in the nick of time he saw a 1903 Suspended Bowl Factory Tubular Separator.

CHAPTER II.

He saw the trouble a bucket bowl always causes—he saw the saving a Tubular Separator always offers. That's why he said "Take away that bucket bowl machine!"

CHAPTER III.

Sharples Tubular Separators are as modern and different from all others as all others are antiquated and alike. The Tubular bowl is hung from a single ball bearing—runs smoothly—doesn't vibrate—can't bind. It contains one tiny piece, and that removable, and can be thoroughly washed in three minutes. It has a bottom feed—thus preventing the mixing of whole and partly skimmed milk—makes clean skimming quick. The low supply can is easy to fill—A six year old child can look into it—it saves the back. The enclosed gears—running in a mist of oil—save power, avoid waste, prevent accidents.

CHAPTER IV.

Our free catalogue tells all about the Tubular. A postal card will bring it and may save you money, work and worry. Ask for No. 144.

The Sharples Co., CHICAGO, ILL. **P. M. Sharples,** WEST CHESTER, PA.

DR. HESS
Great Stock Book
Free

If you will write and say what stock you have—how many head of each, what stock food you have used—and mention this paper. This book is a comprehensive treatise on the care of all live stock and poultry, based on the scientific knowledge and attainments of the eminent veterinarian, Dr. Hess (M.D., D.V.S.); written in popular language; commended and used by veterinarians everywhere. Get it and become a master of all stock diseases. Write to-day, to

STAR BRAND
MOLASSES FEED

ANALYSIS:
PROTEIN 21 FAT 3

For Dairy Cattle and Horses. If your dealers do not keep it write us for prices and sample.

M. C. RANKIN & CO.,
Herman Bldg. Milwaukee, Wis.

The Best Cow

you ever owned would be a better cow both in general condition and milk yield if fed a regular ration of

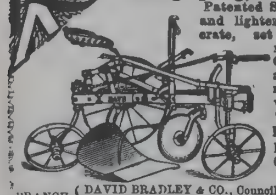
Alma Dried-Molasses Beet-Pulp

When pasture is insufficient or altogether lacking this Food supplies just the needed elements to maintain the maximum yield of milk. It is better than bran and costs less.

Let us send you our printed matter which tells how careful we are to have it proportioned just right and absolutely clean. See, too, what others think about it.

Alma Dried-Molasses Beet-Pulp is unlike many patent "stock-foods." It is a natural product and contains no drugs or other injurious ingredients.

Sanitary Milk Co., Grand Rapids, Mich., writes: "Send a second carload. We find it as a milk producer better than bran."



If you are feeding stock for the market you will find **Alma Dried-Molasses Beet-Pulp** fed with grain the best fattener, because it increases the appetite, aids digestion and assimilation.

Do not confuse this with wet beet pulp which freezes and ferments, or with common dried pulp containing no additional sugar. It takes 16 tons of wet pulp to make one ton of our Food and it keeps indefinitely. The genuine Alma Dried Molasses Beet Pulp contains 72 times as much sugar as wet pulp, and nearly 5 times as much as common dried pulp.

Write to-day for prices, directions for feeding, analysis by U. S. Government expert, etc. Address

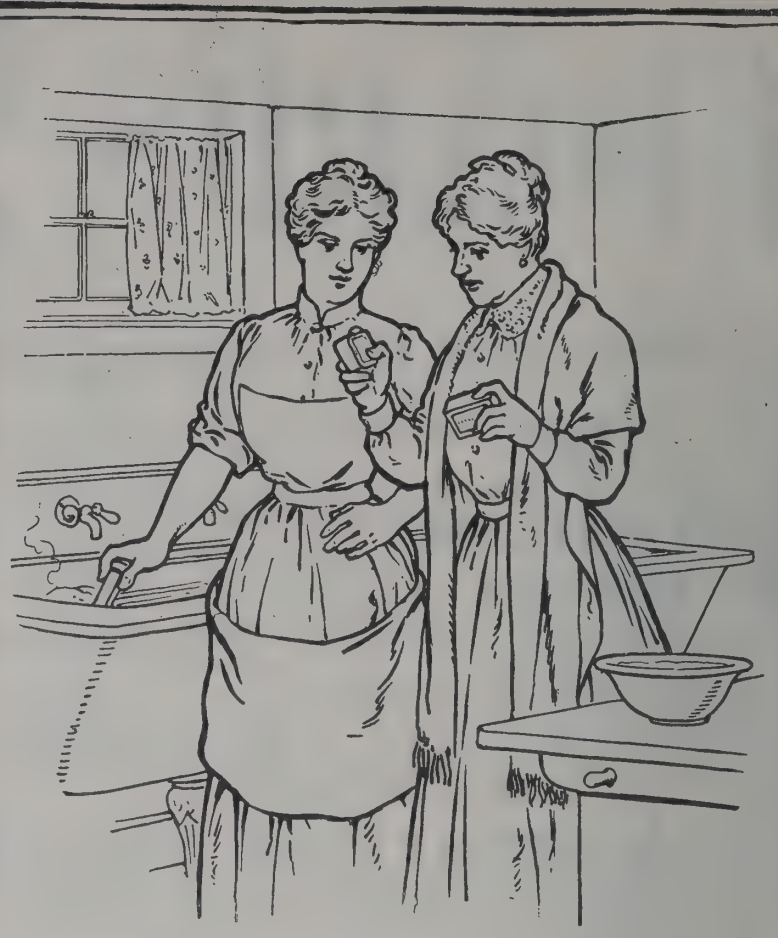
The Farrowing of the Sow.

ED. HOARD'S DAIRYMAN:—One of our Tamworth sows was bred June 13 last. According to our calculation, this sow should farrow October 6, 115 days being the usual period of gestation in the sow. By the middle of September, however, this sow appeared so heavy that we thought parturition was nearer at hand than we calculated. We had, therefore, some hesitation in crating her and taking her to the fair. We, however, risked it, and though we felt pretty sure of getting one of the three prizes on her, we possibly might lose the litter, and certainly would, did she farrow in the crate, and the chances of saving the litter in the small, cramped pens at the fair were not bright either.

Then the risk of crating a sow heavy with pig was also very great in a day's journey in the crate. We escaped any mishaps, however, in this regard, and got our sow home, after a week on the road, all right. This sow now appeared so heavy, her belly almost dragging on the ground, one would imagine that she was going to farrow twenty pigs. Not having farrowed three weeks previous to the date Oct. 6, we were now at ease as to the date of her coming labor. This sow has a mate, a litter sister, and the two are seldom or never seen apart from each other. They go together like Siamese twins, and seem pretty disturbed when parted—so much so that we were obliged to take this mate into the fair grounds, though we were perfectly sure she would take no prize, being under sized, and only carrying about two inches of a tail; the tail being cut off by the sow dam stepping on the tail on a plank floor while very young.



We got the sow safely home Sept. 29, with the others, and she and her mate were housed at night in a pen provided with fenders, and allowed to roam the yard and field during the day. After Oct. 3 the sow was housed at night by herself. On the nights of the 4th and 5th we visited the sow lest she farrow, and to be ready to give her any help and attendance necessary. She did not need it, however. On Oct. 6, the day she was legitimately due to farrow, we decided to keep her in the pen during the day, as no pigs had yet come, though they looked to be dangerously near. All the morning she worried greatly to get out, so we thought there would be no harm in letting her out in the yard, and having taken the precaution to shut all gates leading out to the fields, we kept our eye on the sow all the forenoon, but by noon we missed the sow. We immediately made a search, and found that she had burst open one of the gates leading to a field where there was a clump of thick woods in one corner. We searched the wood, and eventually found her farrowing and had now two pigs.

To leave her here courted disaster, as we had some experience in cases like this before, and that a sow, like bees, does not take kindly to moving from the farrowing nest of her own choosing, and difficult to make her take to the pigs in a new nest, however comfortable. We decided, therefore, to move her to her own pen in the hog house at whatever risk as to injury to the unfarrowed pigs. We gathered the two born pigs in a basket and drove her, out of the improvised nest, home, about two hundred yards distant. After some little difficulty, we got her into her pen, and took the two born pigs into the house by the stove, and gave them a teaspoonful of cow's milk with a little molasses mixed in. The sow was quite uneasy, and did not appear to at all like her new quarters.

For an hour she stood in the pen, ill at ease. By and by she laid down. At three o'clock we glanced in, and found two new comers, one dead, and the other all right; we took them immediately away from her. Then we went to watch by her, and in a short time she had six, one of which was dead, and another of which was a hairless runt, and four of which were big and lively. These we held to the teat as they landed on terra firma, and were soon working out their own salvation with the three that we had previously taken into the house. This made ten, seven of which were large and apparently thriving. It was now nearly sundown, and we shut all doors and left her for the night.

In the morning, when we visited the porcine family there was a new arrival, there being now eight industriously taking breakfast of lacteal fluid. She had

(Continued on page 863.)

The housekeeper must learn to discriminate between Ivory Soap and others that are made to look like it. Each of them lacks some quality of the Ivory and all of them lack its perfect purity. Their imperfections overbalance the slight difference in price. Use the genuine.

Feeding the Young Animal.

Its Future Value Largely Dependent on Proper Food and Care During the First Winter of Its Life.

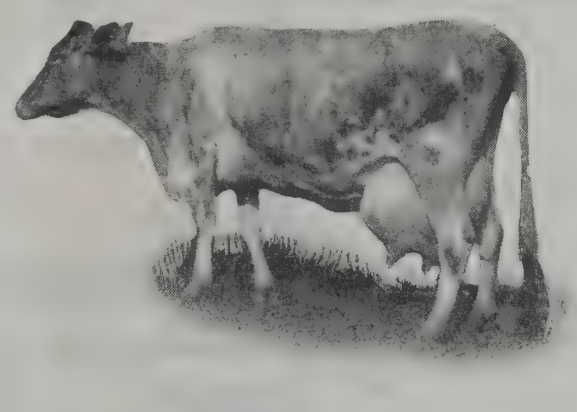
As a veterinarian whose busines, calls him into several states and upon the farms of many, I cannot help noticing the methods and practices of farmers in general. As has been stated in a previous article, my experience has taught me that 60 per cent of diseases of farm animals are caused directly and indirectly by lack of wisdom in feeding. It is not strange that my attention is directed toward the study of farm conditions, and especially to the young things in their struggle to grow up as they are bred to do. Strange indeed, it seems to me, that some men will pay a service fee of $25 or more to the owner of a stallion, and when he gets a foal of promise seem to have some fad in his head regarding care and feed, and follow it out, and spoil the colt; or, if he has no fad notions, will practice a system of negligence which makes a failure in the growing up of a horse of value not much, if any, above that of a scrub. What is true in relation to the breeding of horses applies to the breeding of cattle, sheep and swine as well.

I care not how well an animal is bred, it must be fed along the lines consistent with its breeding, or the owner will meet with disappointment when it grows up. Breeding is simply the starting in of what may or may not be a successful termination. I recently heard a professor in a great university make the remark, "What we need in our university is a man at the head of our department of animal industry who thoroughly understands the animal in its infancy and its conditions on the farm." I was forcibly struck with the truthfulness of the remark. Our agricultural colleges are working on feeding problems and sending out bulletins on the balancing of rations for milch cows and fattening steers which are good in their way, but rarely do we find a word in them concerning the food and care of a weanling colt, calf, lamb or pig.

They tell us of experiments made in feeding hens for eggs, but rarely a word concerning the importance of growing a chicken into a hen to lay the eggs. I find even teachers in colleges have the tendency to skip over the primary necessities—or fundamental principles, more properly called—which are the very foundation of future success. A schoolboy, when he has learned the alphabet, if you let him have his own way would not take up with a primer, but would like a second, third or fourth reader for his reading book. There is a general neglect in our schools to keep along lines of steady, healthful growth in the education of a child, and especially is this true regarding the animal industry department. A large per cent of our boys, when they have taken an agricultural course in a college, don't actually know enough to feed a calf, milk a cow, lead a colt to water (providing they have not got wheels in their heads and gone to town, where they wear choker collars and part their hair in the middle.) The boy is not to blame. He's a good boy by lineage, but parents and teachers made him what he is by the instruction they gave him.

So much for the boy. What about the colt, calf, lamb and pig? Their training we will leave out and attend to the feeding. Like a child, the young animal has an appetite, and it must be satisfied. It has a body, to grow up in some form. The blood of its ancestry will not take the place of food, and that food must be of a kind that will make growth or there will be no growth—a dwarf will be the result in size and general physical development. Everyone knows that, if he will think a moment. To insure health we must have a steady growth of all parts of the body. Consequently the food must be such as to furnish all parts as needed. It is not a scientific balanced ration talk I am giving at this time, but a plain talk to farmers. You shut that colt or calf in a close, ill ventilated stable, to breathe over and over the gases from its own voidings, and you violate the laws of its nature as the first thing, because its nature, like that of a child, is to run, romp and play, and its bone, muscle and nerve will not develop unless it can do it. You make it breathe poisonous gases and its blood soon becomes anaemic and its glandular system becomes diseased. These are facts that cannot be denied, yet hundreds of farmers to-day are wintering their colts and calves in just such places. Others, perhaps, are practicing the opposite, by keeping them in the yard or field, with a hay stack to get their daily ration from. Neither practice is correct; both are violating nature's laws, and lucky the owner is if evil results do not follow.

Now, I know many a man who reads this will sneer, and try to hide behind the practice of his father, or say: "I have done this way for years, and I don't know as I have had any worse luck than my neighbors." That may be true. Such practices are catching, and run over large areas sometimes. You may say: "I ain't had a colt or calf die in years," which also may be true. But you have had many a one grow up dwarfed in size, with a weak constitution, rendering it a fit subject for every epidemic that came your way. If a colt, it had ringbones, spavins, wind galls or puffs, or it may be more subject to spells of colic every time a change of temperature occurred or a change of food was made. If a calf, it failed to make the steer or heifer you expected of it. If kept for a cow, it failed to equal the ability of its mother at the pail, although its sire may have been of a dairy breed, and a grand one at that. You may try to excuse by laying it to the sire or the breed, and may change both in your breeding afterward. But you won't remedy the matter in that way. It is your method that needs changing; nothing else under the sun. Just provide a comfortable stable to keep the young things in when cold or stormy, and a play ground for fair days, and that part of the problem will be solved.



Now, about the feed. Remember, that young creature has got a wonderful appetite, but a weak digestion, and, if a colt, a small stomach, and the food of either colt, calf or other young animals needs to be somewhat more concentrated and more easily digested than that of older animals. This is different teaching from what I have sometimes heard, even at farmers' institutes. I have heard men say the colt and calf needed bulky food in order to give them stomach capacity that it might later in life have the greater power to assimilate food and convert it into muscular energy or milk. Such talk I call simple nonsense. While it is true that all grass eating animals need a food of some bulk, to over-distend the stomach with, non-nutritious and largely indigestible food weakens the digestion in trying to get nutrition out of non-nutrition. A colicky horse is the result, or a cow later on that scours every time a change of food is made. She can't eat much, and consequently can't yield much.

Both are animals not born with weak digestion, but had it fed into them after they were born. What are they good for? I will answer: They are good just as a man is good for business who can't eat by reason of weak digestion. He can't work; neither can a horse or cow under the same conditions be a profitable animal to keep on the farm. Every farmer in the land knows that clover hay—or, better still, fine, well cured, mixed clover and timothy, cut early—makes the best food for rough, dry food raised on farm, but should a colt, calf or lamb be feed wholly upon it, it would have to eat a little too much of it in order to get digestible nutrition out of it. Supply it then with oats and wheat bran. But a lot of people will say, "I have to buy the bran." Well, what if you do? You have to supply sugar and salt and other things for your family, and you sometimes trade things for them like apples, potatoes, butter, eggs, etc. Is it not just as sensible and essential to look after the needs of your animals to some extent?

The future success of agriculture in America depends upon the domestic animals raised on the farm. That statement I defy any one to deny. Then, farmer, look to their needs. If you have a full corn crib and young animals growing up, it is not what they need to grow them; you can't make a balanced ration by feeding corn with your straw, stalks and timothy hay. Do with the corn as you did with the butter and eggs when you traded for sugar. Trade the corn for wheat bran, and if you have no silo or roots to feed for succulence, trade for some linseed oil meal. Then you are on the right track. Your oats you can't afford to sell when you have young animals to raise; or, at any rate, unless you have a surplus—more than your animals need. See that your own animals are fed first, then let the city fellows have the balance.

That is a good rule to go by: If oats are worth 50 cents per bushel to feed a city man's horse, they are worth that to feed your colts, calves, lambs and pigs; yes, hens also. Feed them and get your money for them through the extra value of the animals, and then you will save the fertility on the farm to raise more grain to feed more stock. Save fertilizer bills and veterinary bills, and you won't have to buy condition powders nor any man's "Kow Kure" nor condiment food to bring your animals up in condition. You may ask how much to feed. The answer is: Enough to keep the animal growing every day, from birth to maturity. No strict ironclad rule can be laid down regarding the amount, as there is individuality in animals as well as in men. A rule to vary as may be required I will give.

With the hay mentioned for roughage, a half pound of mixture of oats and bran to a hundredweight of colt, calf or lamb; with timothy hay or corn fodder, two parts bran, one part oats, three-quarters of a pound daily in two feeds; with straw of any kind, a full pound of the last with a handful of linseed oil meal added. Also bear in mind that a few apples, small potatoes, carrots, beets or turnips are a grand thing to feed, the last two for calves and lambs especially. But practice moderation when the succulence is fed. Do not be unwise enough to throw in a scoopful of small potatoes or apples to a colt or calf that never has tasted them, or bad may be the results. At least good, so-called horse sense must be used in feeding animals, and the appetite must be watched, the voidings looked at from time to time, and the food varied as they indicate. When constipated add succulence or linseed oil meal. At all times bear in mind that oats, bran and linseed oil meal rarely cost more than $1 a hundred pounds, while condition powders cost from 25 to 50 cents, stock foods from $10 to $20 per hundred, and veterinarians don't work for nothing. Practice sensible feeding and save your money.—C. D. SMEAD in *Tribune Farmer.*

IMPORTED GUERNSEY COW, HAYES ROSIE, A. G. C. C., 15476

Property of T. L. AMES, Boston, Mass.

This cow gave in five months 6,872.2 lbs. of milk and 312.26 lbs. of butter fat.

Form of Contract for Renting a Farm.

Make a Contract Specific.

This indenture witnesseth: That John Jones this day leases to John Smith, both of Washington township, Marion county State of Indiana, the following real estate, to wit: The west half of the southwest quarter of Section twenty-four, township seventeen north, range three east, containing eighty acres more or less, situated in Pike Township, Marion county, State of Indiana, with all the buildings and appurtenances belonging thereto, said John Smith to have and hold full possession of the same for the term of three years from the first day of March, 1904, and said John Smith shall further have the right and privilege to enter said premises during the fall of 1903, for the purpose of preparing the land and sowing wheat. Said premises to be used only for farm and garden purposes. Said John Smith agrees to handle and cultivate said premises after the manner of good husbandry, and return the same to its owner in as good condition as when he received it, excepting the natural wear and unavoidable accidents, such as tornadoes and fire, and in such case the said Jones shall make the repairs and be held to said Smith for damages in case he does not speedily make said repairs. And Jones further agees to put the buildings and fences in good, reasonable repair before the first of March, 1904, and said Smith is to keep said premises in repair during his lease, except as above named. Said Smith further agrees to sow all land to clover that is sown to wheat. Said Smith is to have enough of the dead timber on said premises for fire wood for cooking and heating purposes of said premises.

Said Smith further agrees to cut all obnoxious weeds, briers, alders in due season, and haul upon the cultivated land all manure made on said premises during his lease. In consideration of the use of said premises, said John Smith agrees to pay said John Jones the sum of——— dollars per year, one-third to be paid October the first of each year, and two-thirds the first of February each year. (Or, if grain rent is to be paid, say that said Jones is to receive one-half of all products raised on said premises, at premises, as they mature, in condition ready for market; to be received by said Jones on the premises in stack, mow or bin as said Jones may provide.) Said Jones further agrees to furnish all new material on the premises for repair of buildings, fences, etc., and said Smith agrees to repair the same, except as above named. Said Jones reserves the right to enter upon said premises to make improvements for its betterment, subject to all damage done said Smith. Said Smith may be ejected from said premises at the close of any year, on failure to comply with terms of this lease, and shall deliver the same to the owner, at the expiration of this lease, without further notice.

The above lease should be signed in

duplicate by both parties, and propely witnessed.

I think the better mode of leasing a farm, for both owner and tenant, is the following:

An article of agreement made and entered into this day by and between John Jones, party of the first part and John Smith, party of the second part. The party of the first part leases his farm, situated in Warren township, Marion county, Indiana, described as follows, to-wit.

The northeast quarter of Section 12, Township 16 North, Range 4 East, in county and state above named, to the party of the second part for the term of five years, from the first of March, 1904. Said Jones is to furnish the said farm and one-half of the live stock and one-half of all tools, harness, machinery, and whatsoever is needed to run a well regulated farm in good farm order, and the said Smith is to furnish the other half of said tools, machinery, stock, etc. Each party shall bear half of the repairs and replenishing of said tools and stock, and all live stock purchased for breeding or feeding purposes shall be paid for by the above parties, half and half, and shall be joint and equal stock. Said John Smith agrees to cultivate, harvest and garner the products of said farm, and to breed, raise and fatten such live stock as will be the most advantageous to both of the contracting parties, and to feed or haul to market all the products of the farm, and the proceeds are to be divided equally between the said John Jones and John Smith, and the whole arrangement and management of the farm shall be mutual between the contracting parties. Said Smith is to have firewood for family use from dead and decaying timber. All tools, machinery, live stock, or other property of the partnership, shall be divided equally between the said John Jones and John Smith at the termination of this lease.

(Signed), JOHN JONES.
JOHN SMITH.

The above parties personally appeared before me and signed this lease.

[Seal.] JAMES TAYLOR,
Notary Public.

There are a few things to be remembered in regard to contracts. Contracts of over three years duration must be signed before a Notary Public and recorded. You should be specific in your contract, for you cannot give oral evidence against a written contract in court.

If you rent a farm for a single year, you would better specify what grain is to be sown or planted in each field. I would say to the landlord, find a good renter and hold to him; and to the renter, find a good landlord and stay with him.

It is better for landlord and tenant, for the tenant to be able to plan for future crops. The landlord should not expect the renter to take a rundown farm and bring it up to a good state of cultivation at his own expense, and the tenant should endeavor to keep the farm in as good condition as he received it, so that the passer-by will not say, "that looks like a rented farm." Be mutual, be just.—I. N. C. in *Indiana Farmer.*

Wisconsin Law Regarding Farm Fixtures.

G. P., West Rosendale, Wis.: "Have recently purchased a farm; contract reads "With buildings and fixtures of every description." There was in the barn a horse fork with rope and all pulleys complete. Former owner claims he can take away the car, pulleys, rope and fork; also hooks that are screwed into the timbers of barn; in fact, all except the track the car runs on. Can he take away any part of the outfit or all of it?

ANSWER.

Our statutes do not define what specific articles shall be considered fixtures and hence pass with a conveyance of the land. Whether an article is or is not a fixture must be determined from principles of law as laid down by the courts, and the application of those principles is by no means easy, since such questions are mixed questions of law and fact. As said by our Supreme Court in Taylor vs. Collins, 51 Wis. 123; "The difficulty in such cases is not in the rules to be adopted by which the question is to be determined, but in the application of correct rules to the facts of a given case."

In the same case the court laid down the following rules for determining what is a fixture; "First, actual physical annexation to the realty; second, application or adaptation to the use or purpose to which the realty is devoted; third, an intention, on the part of the person making the annexation, to make a permanent accession to the freehold." The court has adhered to these rules and affirmed them in Homestead Land Company vs. Becker, 96 Wis., 206, and again in Gunderson vs. Swarthout, 104 Wis., 186. In the latter case Chief Justice Cassoday says further: "Where the machinery is adaped to the purpose to which the realty is devoted, and is for the permanent use and improvement of the freehold, it is a fixture and a part of the realty; but where it is attached for a mere temporary use, with the present intention of removal, it continues to be personal property."

As stated by the Supreme Court, the difficulty comes in applying these rules to the state of facts you have given us. The track and the hooks, to which the pulleys are hooked, are actually physically annexed to the realty, are adpted to the use to which the realty is devoted, and were probably put there with the intention of making a permanent improvement to the farm. However, this question of intention is a question of fact upon which a jury would pass. But it seems that there would be little question but that they would be considered fixtures and pass with the farm under your contract. With the carrier, rope, fork and pulleys there is more question. None of these are physically attached to the soil. There is no question but that they are adapted to the use to which the land is put. It would seem also that they must have been put there with the intention of making a permanent improvement to the farm, but here we are again trespressing upon the province of the jury. Another important fact in your favor is that the track is of no value without carrier, and the track has been built with especial reference to the particular kind of carrier put in. Our Supreme Court has never passed upon a case of the kind. However, it has approved the action of the New York Court in holding that hop poles piled upon land and used season after season were fixtures; and that rails or other building material deposited along the line and ready to put in were fixtures also. In our judgment, the track, hooks, and carrier are fixtures and have passed to you under your contract. We also think that you have a good claim to the rope, fork and pulleys, especially if they have been used for no other purpose than in connection with the carrier..—*Farmer's Sentinel.*

Value of Cows According to Capacity.

Just how much a cow is worth can only be estimated from what she returns for the feed she consumes. Prof. A. H. Wheaton furnishes some very interesting figures based upon present prices of dairy products, which may be of interest to many in determining just where they do stand in cow wealth. It will be noticeable that while the cow that makes 900 pounds of butter is valued at a little over $2.00 for every pound, the one that makes 325 is put down at less than one cent a pound for what she produces, showing that the extra pounds are what count.

Cows that make 300 lbs. of butter or less, beef value							$ 30
Cows	that	make	325	lbs.	of	butter	35

Pure-Salt Bricks

are all salt, no impurities. Improve the quality and yield of milk. A modern convenience, always present, animals never neglected, and costs for each only about a nickle a month. See how they enjoy helping themselves when you place it within reach. For all stock. Buy of dealers or send for free booklet to

Belmont Stable Supply Co., Brooklyn, N.Y.

How to Make a Lawn.

Experts at the World's Fair Have Installed Many Acres as Exhibits—Some Enemies of the Lawn.

The six-acre rose garden at the World's Fair would not be such a beautiful sight were it not for the belts of blue grass lawn that surround the beds. The slopes to the miniature lakes that contain the rare and beautiful aquatic plants, the terraces, the clumps of shrubbery, would all lack something were it not for the lawns. The lawns are not merely the frame but a real part of the picture. It is the smooth stretch of green, with perhaps a gently undulating surface filling in the otherwise barren spots, and resting the eye, which brings out boldy the more pretentious beauty of the many colored flowers, the grace of the clumps of shrubbery or the stately beauty of the trees. The great ivory palaces of the Exposition would lose much of their grandeur were it not for the lawns that surround them.

The World's Fair lawns, in the 69 acres comprising the agricultural section, are exhibits, and they have been as carfully planned as any of the other show spots in the outdoor section. Mr. Joseph A. Hadkinson, who was appointed superintendent of outdoor planting by Chief Frederick W. Taylor, appreciates the value of the lawn in giving an artistic finish to his work, and the lawns, all of which were planted under his personal direction, will be admired by millions of visitors during the fair. Already they are beautiful and each day adds to their attractiveness.

The conditions, under which the World's Fair lawns have attained perfection, establish beyond question the fact that splendid lawns may be grown under the most discouraging conditions. All along the east side of the great Palace of Agriculture a few months ago was a mass of yellow, sticky clay. A ravine, 17 feet deep, was filled with clay brought from the top of a neighboring hill. This was smoothed, plowed and harrowed and a top dressing of good soil, nearly a foot thick, was spread over the clay. This was worked, pulverized and prepared for the seed.

The seed selected was blue grass and rye grass, mixed in equal parts. The rye grass was first in evidence, but it has done the work that was required of it and has passed away. The visitor will never know it existed, unless he makes inquiries and learns that the blue grass is indebted for much of its beauty to its less known brother, the rye grass. The rye grass peeps up in six or seven days and is a nurse crop for the blue grass. It grows taller and shields the blue grass from the sun. It is not a perennial, and as it is not permitted to go to seed on a well regulated lawn it dies out and leaves the blue grass alone on the field.

One can tell on an October morning in St. Louis why it is called "blue grass." Walk over the lawn early in the morning before the dew has disappeared. The rye grass is the taller, and with its spears covered with the dew it has a vivid green color. The blue grass spears are nearer the ground and in the coating of dew each spear takes on a light blue, but an unmistakably blue color. The blue grass is exclusive, and wherever it takes a stand all weeds and other common grasses are crowded out.

But there are things about planting that Mr. Hadkinson knew and did, that had much to do with the success of the World's Fair lawns. After getting the ground into proper trim the seed was sown, broadcast by hand, one pound to each one hundred square feet. The seed was covered with what he calls a "choppy" motion. A gardener goes over the lawn with a rake, and instead of raking and rubbing the seed in, he swings it slightly and allows the teeth to enter the soil about an inch. When the rake is lifted the soil is turned under for about half an inch. Then the pulverized soil must be treaded to fasten the seed in the ground. On the comparatively level places, a heavy roller is used. On the terraces, and some of the World's Fair terraces incline at an angle as great as 30 degrees, a "pounder" is used. This is a board a foot wide and a foot and a half long, fastened to a handle, with blocks added until it weighs about 15 pounds. The surface is "tamped" with this.

When the earth is smoothed the final work is done. All summer long a great pile of stable manure had lain in a neglected heap in front of the garden. It was thoroughly decomposed. This was run through a soil pulverizer and after being granulated was sprinkled over the ground. The covering is slight, but is all that is needed. It keeps the sun from baking the soil and causes it to retain the moisture. No other fertilizer is used. Having done this, Mr. Hadkinson waited, and nature is doing the rest.

There is one pest that has demolished many a beautiful lawn, and the World's Fair landscape gardeners had a short bout with it before they succeeded in overcoming it. This pest is the mole. These little fellows with wonderfully powerful fore paws, and soft and glossy fur, burrow a few inches under the surface of the ground and raise ridges in the lawn. The moles feed on the earthworms and harm the roots of the grass only incidentally. But if the moles are not killed they will destroy the lawn. Traps are freely advertised but seldom prove effective.

"Gus," Mr. Hadkinson's foreman, is a fearful foe to the mole. He watched Mr. Mole and studied him. The mole takes his meals regularly—at 6 a. m., noon and 6 p. m. and at any of these hours is the time to catch him.

The ridges made by the mole must be beaten down, and watched. When the mole goes over the route again the ridge is again raised. Then the process is easy. Take a spade, drive it in the ground across the mole's route and behind him. Unless this is done he will skurry underground and find safety in one of the deep holes that he has provided for emergencies. But the spade stops his progress and he may be easily dug out and dispatched. In less than a month the moles were banished from the agricultural section of the World's Fair.

Will be Plenty Sorry by Spring.

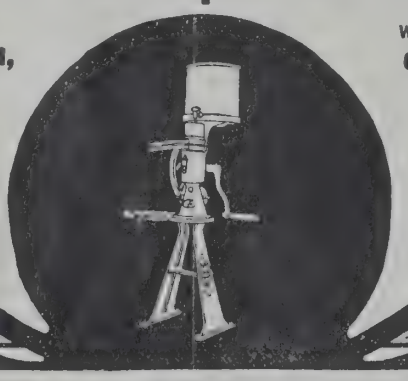
Referring to present conditions of the fodder question in Minnesota, Prof. Haecker writes as follows in *The Dairy Record*.

The coming winter, it is going to be specially difficult to secure a large flow of milk on account of the great scarcity of good palatable hay and good fodder corn. Most of the hay got wet before it was stacked, and much of it was damaged in the stack by the numerous rain storms. Some of the fodder corn was caught by the frost, and that which was shocked before the wet spell was badly injured, and nearly all will show considerable mold and later on will be musty. Those who put the fodder corn into a silo before or immediately after the frost are exceedingly fortunate, and we are in that class. We have some 300 tons housed in two silos, and it is of fine quality, and the cows eat from thirty to fifty pounds a day. But cows will crave for something besides grain and silage, so have to feed a little hay, but we find it almost impossible to get that which is uniform, unbleached and palatable. We are paying $13.50 for wild hay, feeding half as much in weight as we do of grain. Cows getting six pounds of grain are fed three pounds of hay, those that take twelve pounds of grain get six of hay. They eat every spear, and then reach over and steal some of their neighbor's bedding. Did you ever notice that a cow will eat her neighbor's bedding when she would not touch hers, and the more difficult it is to reach it the better she seems to like it?

Later on, when the fodder corn gets dry, we will substitute it for hay with those animals that are not used in experimental work, and with the young things. With hay at $13.50, oats a 35, and corn and barley at 40 cents per bushel, profits in milk production are not very large, even if one is employing good cows and takes good care of them, and those who are using the beef or dual-purpose cow will be plenty sorry by spring.

Creasey Ice Breakers

Dairymen and shippers of milk and cream find them most efficient, economical machines, and the greatest savers of time and ice. Easy to operate. Rapid cutters. The design is right. Made is sixteen sizes to suit every requirement. Send for catalogue "11-B" whice givis full particulars.



J. S. L. WHARTON, Mfr.,
17th Clearfield St., Philadelphia, Pa.

EMPIRE

There is no royal road to success, but there are roads which are harder than others. There is no way to make money out of dairying without work, but there are ways easier than others. The EMPIRE way is the easy way. It is the way to make the most profit with the least labor and the least expense. It is the most satisfactory way. The EMPIRE Cream Separator is the easy machine to operate and the most profitable machine to use. It is easy to buy because the increased profits pay for it. It is easy to operate because of its simple construction. Our book tells about the EMPIRE way of dairying and about the EMPIRE Cream Separator. It is free for the asking.

Empire Cream Separator Company,

Main Office **Bloomfield, N. J.**

Western Office **Chicago, Ills.**

From Cow To Cream

is but a short journey on the farm that runs the

AMERICAN Cream Separator,

the one that gets the profits, and runs without an expert. We let you test it yourself and return if it is not a money maker for you. The price makes it easy to buy. Write now for free catalogue.

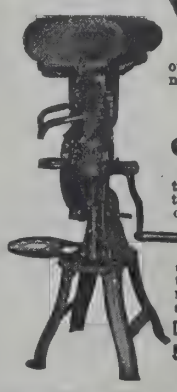
American Separator Co., Box 1025 Bainbridge, N. Y.

Awarded Medal at Paris Exposition.

THE Iowa Dairy Separator.

AN UP-TO-DATE MACHINE REPLETE WITH PRACTICAL IDEAS

It is built in the following sizes:



250, 350, 450, 600, 750 POUNDS PER HOUR

Our 750 pound per hour machine is a practical Hand Separator. It is as easily run as most separators of 450 pounds and 500 pounds capacity.

SEND FOR CATALOGUE NO. 60 AND PRINTED MATTER.

IOWA DAIRY SEPARATOR COMPANY, WATERLOO, IOWA.

WANTED!!

Every reader of this paper who owns a few cows to send for our new catalog of

DAVIS Cream Separators

Sent free upon request. It will tell you why the Davis Separators are money makers for their owners.

THEY ARE GUARANTEED to separate THOROUGHLY and QUICKLY. Dairymen and farmers find the "Davis" the most economical piece of machinery on the farm. Let us send you full particulars about it

DAVIS CREAM SEPARATOR CO.
54 to 64 N. Clinton St., Chicago.

BARGAINS IN CREAM SEPARATORS

We offer a good selection of separators, DeLaval and other makes, some second-hand, having been taken in exchange, others only shop worn, being machines used for fair exhibitions and the like. These will be offered at low prices as long as they last. Write us at once for full particulars.

STODDARD MFG. CO.,
RUTLAND, VERMONT.

CREAMERYMEN, DAIRYMEN and MILK DEALERS

Can be Promptly Furnished with anything they want at reasonable prices, if they will write me. My CHILDS' PATENT MILK BOTTLE FILLER is the best on the market. Send for free catalog.

J. S. BIESECKER,
59 Murray St., New York City.

30 DAYS FREE

Why buy a "pig in a poke" when you can get the

ROYAL INCUBATOR on 30 Days Free Trial. Absolutely self-regulating. Try it and keep it only if you like it. Send for catalog and free trial plan. With poultry paper one year ten cents.

WILL IT PAY YOU TO TAKE HOARD'S DAIRYMAN?

W. H. Jenkins took a census in 1901 of 50 farmers who were patrons of the creamery in Montrose, Pa. Twenty-five of them read dairy papers; twenty-five did not. The twenty-five who did read dairy papers averaged $50.23 per cow for the year. The twenty-five who did not read averaged $32.95. Here is a difference of $17.28 per cow. Did it pay the twenty-five to read? Did it pay the other twenty-five not to read? That's not all. Those who did read averaged a profit over cost of food of $15.06 per cow. Those who did not read averaged a profit of 66 cents. Is not that dairy farmer standing greatly in his own light who will not pay 2 cents a week for Hoard's Dairyman? These are hard facts worth thinking over.

COMING EVENTS.

THE farmers of Japan raise, perhaps, the heaviest crops known to the world, and the superior productiveness of the small lots of land held by peasant proprietors will be apparent from the fact that, with but 11 million acres of cultivated land, 34¼ million people are fed and clothed for the greater part, and are still able to export 25 million pounds of tea, 3 million pounds of raw silk, and 35 million pounds of rice.

THE death is announced from Paris of Professor Nocard, the well known French bacteriologist and authority on infectious diseases in animals, at the age of 53 years. Professor Nocard was one of Dr. Pasteur's chief assistants in the researches into the curative properties of serums. For several years he was the head of the famous veterinary college at Alfort, but he resigned that post in order to devote himself entirely to research. He took an active part in combating Dr. Koch's theory of the non-transmissability of bovine tuberculosis to human beings, and was a very strong advocate of the tuberculin test. Some useful work was carried out by him in reference to abortion in cows and mortality in calves. Last March Professor Nocard stated that he would shortly be able to announce a remedy for the foot-and-mouth disease, but he was struck down before he could complete his investigations.

ONE REASON WHY HOARD'S DAIRYMAN IS A GOOD ADVERTISING MEDIUM.

Hon. Whitelaw Reid contributes a very strong and thoughtful article to the "Sunset Magazine" on "Journalism as a Career." In the same he reasons out clearly, some of the foundation principles of successful advertising. Here is what he says in one place:

"Now what the advertiser first thinks he wants, roughly speaking, is publicity. It takes more thinking on the subject, more observation and experience, to satisfy him that what really does him good is a particular kind of publicity. * * * * The sagacious advertiser understands perfectly that his announcement does more good when it goes to readers who *have the buying* habit and the means to indulge it; and therefore that *character* of circulation is far more important than mere quantity."

Never were truer words penned on the advertising question, than the above. And yet a great majority of advertisers, do not see it. They cast aside this deeper, wiser judgment, and throw their money away on journals, that make a practice of gathering up a mass of riff-raff readers by all sorts of means. HOARD'S DAIRYMAN never pretended to have a big circulation. It does pretend and strongly affirms that it has a circulation among the very cream of the agricultural class, farmers who stand up as business men; who have ideas and sufficient knowledge to know that they need the things that will help them economize the expense of labor, increase the amount and improve the quality of their product and increase the efficiency of the capital, they have invested in their business. Such men are liberal buyers of the things needed in their line. They are readers of HOARD'S DAIRYMAN; they have followed its teachings for years, and found them fairly reasonable and right. The paper has never trifled with their confidence or made merchandise of that confidence for selfish ends. It may have been mistaken, but if so, it was honestly mistaken. For this reason it has built up an advertising patronage that is at once our pride, our great concern, and one of the chief features of the usefulness we hope to accomplish. Every year witnesses a constant clarification of our subscription list. The unbusinesslike dairyman may start to read it, but for the very reason that he is unbusinesslike, he soon tires of it and drops out of its current of thought. Some have the steadfastness of purpose to stay and take the education such reading is sure to give. New men are constantly enrolling themselves in its membership. A portion of these are of the sort that grow, stay and win out. They realize that the day of wornout ideas and methods in all the branches of dairying, have gone by. To them the paper is a constant help, and inspiration. It is for the coming, growing man that we work. His tribe is constantly increasing. Because of all this, HOARD'S DAIRYMAN is every year becoming a more valuable advertising medium.

Please Read and Consider.

As is well known, HOARD'S DAIRYMAN has for years set its face strongly against the idea of the general or, some say, "dual," purpose cow for the farmer who is looking for a good profit in his milk. On page 828 in last week's issue, John Gould, in his "Note and Comment," gives the experience of the noted New York dairyman, H. E. Cook.

We hope every one of our readers read and pondered on that experience, but for the sake of many new subscribers and others who will this week read the paper for the first time, we reproduce it:

Herbert E. Cook, of Denmark, N. Y., is New York's most thorough and practical dairyman and his cow lore is beyond the books. Several years ago he had the dual-purpose idea well developed and later on the cross-bred cow, uniting two of the best dairy breeds. He found the first cross a fair cow, but not as good as either of the foundation stocks. Now, for years he has been lining up with one breed, and is making a great dairy out of this straight and away method. In a recent letter to a journal I find these three sentences, which contain a mint of suggestion: "The cost of production to-day is tremendous. Milk must be produced with a cow machine especially adapted to the work in hand. Any community that goes "crazy" over the milk business with a combination cow, will sooner or later regret its "insanity." Some people do not find out in their lives what they are fitted for, so with the dairyman with dual-purpose cows. This dual-purpose matter is a grievous error. Now and then a phenomenal cow is produced, only often enough to prove the rule that milk and beef are not found in perfection in breeds, or combinations, as a whole." The milking of beefy cows is dairying on the ragged edge. The eastern dairyman is succeeding in competition with the west, only because he is not handicapped with a beefy cow.

The little girl said she did not like to go to Chicago "because there was so much to see she couldn't see anything." It is somewhat so with many farmers "who do the dual-purpose cow pursue." They want so much, (milk and meat) that they do not economically or profitably produce either. It is better always for the dairyman to confine his thought and purpose to the study of milk production. To that end he must study how to breed for milk, and then he will learn to take advantage of the milk breeds of cattle, and the hundreds of years that have been spent in developing dairy quality and capacity in these cattle. It does not pay to spend years in living at cross purpose with our best opportunities and best profits.

Proportion of Butter to Fat in Milk.

Considerable has been said first and last concerning what should constitute the proper amount of overrun in creamery butter. It has been the contention of the DAIRYMAN that this overrun cannot be rightly estimated without taking into the calculation the per cent of fat contained in the milk from which the butter is made. On this question of the proportion of butter to the fat in the milk, Prof. Long, of England, in his "Elements of Dairy Farming" has this to say:

"Many more or less successful attempts have been made to enable the dairyman to ascertain, in a simple manner, what percentage of fat any sample of milk contains. There has not, we believe, been any attempt made to show what percentage of butter, a given percentage of butter fat will produce. A crude method has sometimes been adopted, that of esmating the percentage of water, salt and casein in butter as equivalent to the fat which has been lost by imperfect skimming and churning.

It is quite probable that when the work is badly done throughout, this method of calculation may be applied with approximate precision. We have, however, made an advance in butter making, and with the separator, with carefully ripened cream, and good work with the churn, the loss of fat is so small that another and more scientific mode of calculation must be adopted.

Dr. VanSlyke of the Geneva (N. Y.) Station adopts as a standard, butter containing 85 per cent fat.

For butter produced in a dairy where practically no loss is supposed to occur through want of skill, this figure is low for it assumes that nearly 15 per cent of water is left in the butter, or .45 per cent more than the average of 2,000 samples taken from two to three hundred dairies in all parts of Denmark. Nevertheless, it represents average butter. If no fat were lost in the process of manufacture, it would be sufficient by this standard to divide the actual per cent of fat in the milk by .85 to ascertain the quantity of butter it would be capable of producing per 100 pounds of milk. But we know fat is lost both in creaming and churning. If, therefore, we estimate this loss upon the basis of the abundant existing data, we are able to arrive at a solution of the question.

When cream is obtained by separation, the loss of fat averages about .15 per cent and where cream is perfectly churned, the loss of fat is about .05 per cent. Now if we make these deductions from a given percentage of butter fat—let us say 4 per cent as an example—we have 3.8 remaining. This amount, divided by .86—which we believe to fairly represent the percentage of fat in good British butter—leaves 4.41 as the weight of butter, which under the conditions suggested, we may expect to obtain from 100 pounds of milk containing 4 lbs. of fat."

Creamery Consolidation.

The recent letter of Prof. Haecker on the dangers of creamery consolidation is fully endorsed by Prof. A. H. Wheaton, of the South Dakota Agricultural College in the following letter to the New York *Produce Review*:

I most heartily endorse the article from the pen of Prof. T. L. Haecker which appeared in your valuable paper of Sept. 30th, entitled, "Warns against Creamery Consolidation." These have been my sentiments ever since this craze began to develop. I foresaw at the start some of the evils which now are beginning to develop, but was criticised by some of our leading writers and publishers in this state, then and since, so that I cannot let this pass without raising my voice in commendation of one who is brave enough and who from his position is independent enough to stand up and tell the farmers the whole truth without fear or favor. Truly, "a little knowledge is a dangerous thing" which is beginning to make itself felt among those who had so little knowledge as to have been led to believe that something from nothing could be obtained. When these centralized plants first started they had a large capital to drawn from, by reason of the sale of shares of stock, whereby they could if necessary pay more for cream than it was worth at home, but conservative business management will not allow them to do this only until the home creamery ceases to be a competitor.

Some have reached this point now, the patrons of which are slowly but surely learning the old lesson that one cannot pay freight on the raw material over a long distance and return the cans to their patrons at so much per can, and still make butter cheaper than it can be made at home on the co-operative plan. After the cream has stood on the local depot platform for several hours in hot weather, then transported (in some cases by rail three hundred miles), it is not possible that a better grade of butter can be made from it. The processes of deterioration are slow or swift, according to temperature and local conditions of the atmosphere, so I leave it to the average intelligence of the average farmer to judge whether or not the quality of cream will be enhanced by the long transit process, more than by the local creamery process. It is true that cream can be doctored to some extent, so can the farmer when he becomes sick, but who would not prefer to be kept well, rather than be compelled to take the doctor's prescription after one has been made sick by injudicious care of one's self. Likewise who would not prefer butter made from pure cream in a local creamery to that made from doctored cream? You pay your money and take your choice.

The Man Behind the Cow.

Speaking with a very capable dairy farmer, not long since, we were much impressed with some of his ideas:

"HOARD'S DAIRYMAN is all the time holding up the value and importance of the well bred dairy cow," said he. "In that you are right. But did it ever occur to you that as dairy farmers and hired men we need to be better trained, better educated, and much better qualified than we are, to keep up with the kind of cows we are trying to produce? You advise the farmer to turn off his poor cows, but how is the good cow going to turn off the poor farmer?"

"The great mistake the great mass of farmers make who keep cows, is in supposing that the way they have lived and the little they have really studied cows, fits them to do business with cows.

"I found years ago, that I did not know enough to handle cows so as to get the best profit out of them. I found that

poor as my cows were, they were better fitted to go ahead in the work, if they had a fair chance, than I was. It hurt my pride a good deal to come to this conclusion. Well, I went at it. I made up my mind I would not sit down like a dolt and not understand my business. I want to say to you that I believe I could to-day make twice as much profit as I did fifteen years ago, even with the same cows that I had then, I can't make my neighbors see these things, so I've quit trying. They really talk among themselves that I am losing money because I spend four times the money they do in improvement.

"My cows are twice as good as those I owned 15 years ago, and I don't lose one animal now, where I did two then. I took your advice and went to studying and reading. All the books and papers I've bought haven't cost me fifty dollars, but they gave me hints and ideas, so I began to see things for myself.

"One thing I got, and that was courage to go ahead and do the right thing. I paid $150 for one bull, and he has been worth a thousand to me. I went at the stables and the farm and the feed question, determined if there was a better way of doing things, I would know it,

"I want to tell you there is no comparson in the satisfaction I get in my work to-day over what I had when I started. My bank account tells me that it is all right. Keep up your preaching; you are on the right track."

Some Comments on the Dairyman.

ED. HOARD'S DAIRYMAN:—For three past months, I have been trying to increase the list of subscribers to your valuable paper, first to help and make more profitable the leading industry in our county, and second to compensate the senior editor for his kindness in visiting our fair and delivering useful addresses to our people. I talked personally to many in order to get them to subscribe. Now I want to say a few words to those who are not only new, but who are old subscribers, and while I am not at present keeping cows, still the DAIRYMAN is so well filled with practical facts that I read it carefully every week, and I desire to call attention to some articles in the last issue, Oct. 23, that will bear re-reading.

Two articles appeared, either of which in the writer's opinion are worth a year's subscription, whether you are dairying or not. The article from the pen of Mr. Wing describes a scene which has transpired in many a happy home, when the cause was unknown. And now that it is told and the cause traced out, be careful and watchful that no such trouble is lurking around your own premises.

It reminded me of something I have told of many times in speaking of the pure air on our high ridges in this La Crosse county, and now, after reading friend Wing's experience, I will add pure water. I have been connected with ridge farming for thirty-five years, ever since I started my orchard, and have often said I have in that time never known of a case of typhoid on those hills. Doctor Palmer, an old practioner here, has told me the same, while at the foot of the hills and in valleys, many deaths have occurred.

Now, the fact that on these high lands the water for cooking and drinking is drawn from very deep drilled wells, or brought from springs at the bottom, would go to prove Mr. Wing's theory to be correct. So I say, read and profit by his article. Next, to a man who is directly or indirectly interested in dairying, Prof. Beach's valuable article on the Dairy Cow ought to be read several times, especially that part embodying the report of the production of those twenty-five cows, showing conclusively the value of the Babcock Test in the dairy for the purpose of weeding out the unprofitable animals. Space will not allow a review of this excellent article, but I say, read it again carefully.

I note in John Gould's article that on feeding apples to dairy cows, he says: Possibly some kinds are better than others. True. Actual experience has taught me that a feed of Whitney No. Twenty, apples to cows from half bushel to three pecks per day for several weeks, in addition to other feed, increased the cash value of cream checks every time, while a mixed lot of all grades made little difference. This fall, apples are scarce, and there is no more probability of any cows getting drunk on apples than there is of tramps getting drunk on the handouts from farmers, which are made up of apple pie. But I must close by stating that in my opinion the article by the editor on the hired help question is true and to the point and will bear re-reading, also the one on the key note of the situation. My wish is that the DAIRYMAN will have a much larger circulation. A. J. PHILIPS.

LaCrosse Co., Wis.

The Educational Butter Test for 1904.

ED. HOARD'S DAIRYMAN:—We have sent out a circular to all buttermaker members of our Association, requesting those who wish to enter the Educational Test for 1904, to express their wish in writing.

The Second Annual Educational tests are about to be completed, and in conducting same we have had opportunity to find room for various beneficial changes.

Should we have a test in 1904, I would favor sending every package by refrigerator freight, the charges to be collected at destination, and deducted from the proceeds of the first tub. This would save those participating on an average $3.00 for the six tests, for the express charges are often extortionate, ranging from 50 cents to $1.75 and $2.00 for 20-pound tub, and averaging at least $1.00 per tub. Besides, the express companies do not take proper care of the butter, and often it comes heated, even when packed inside of a 60-pound tub.

I would also recommend allowing each buttermaker to send his butter from any day's make he chooses. Under our present system the call often reaches the buttermaker on Monday, when his milk is naturally the poorest, much being held over Sunday. We have always sent out the calls so as to reach the butter-buttermaker between Tuesday and Saturday, but I find that Uncle Sam is very unreliable when it comes to delivering country mail, and have long ago given up relying on same.

I think every buttermaker who wishes to improve his make should be in the National test as well as the tests conducted by his state, where such is available. The results in detail of the Second Annual Tests, which I hope we will be ready to publish in November, I think will prove that I am right.

Those who enter the Educational Tests for 1904 will be able to compete with the same package for the World's Fair prizes in St. Louis, as well as for the National convention pro rata and other prizes.

In conclusion will say, that I do not believe our Executive Committee will decide on another test unless, at least, 500 buttermakers participate. Those who have not received a circular and desire to participate should advise me at once.

E. SUDENDORF,
Sec'y N. C. B. Ass'n

Elgin, Illinois.

Address after Nov. 1, 3831, Windsor Place, St. Louis, Mo.

The cows in Belgium wear earrings. This is in accordance with law, which decrees that every animal of the bovine species, when it has attained the age of three months, must have in its ear a ring to which is attached a metal tag bearing a number. The object is to preserve an exact record of the number of animals raised each year.

INQUIRIES AND ANSWERS.

Every inquiry must be signed with the name, Post-office and state of writer. Condence the questions into plain epecific inquiry. Be careful to note if your questions eave not been answered in replies to others. We are glad to answer all the pertinent questions that we can concerning machinery. Look over our advertising columns and write to the advertisers.

Red Polled Cattle.

Would you please give a description of the Red Poll cattle? Would like to know about their milking quailties? Also the nearest breeder to California, of whom they can be purchased? Have never had any experience with them, but would like to learn all we can about them.

Kingsburg, Cal. C. & B.

As the name implies, these cattle are deep red in color and are hornless. They are possibly the nearest approach to the mythical dual-purpose animals that can be found. There are not enough of them in this country to establish a specific rating in the beef market, but it is extremely probable they would fall below Short-horns, Herefords, Angus and Galloways and somewhat above any of the dairy breeds, for of all the foolish people in the world, there are none that can compare in downright folly and prejudice with the average butcher and buyer for the great slaughter houses. It has been demonstrated over and over again from their own reports and figures, that the grade dairy steer slaughters just as profitably and fattens just as profitably as the best beef bred animals, and yet they are discriminated against by from one cent to three cents a pound in market.

As to the milking qualities of Red Polls, it is but fair to say that many of them have made excellent records, both in the home dairy and at the Pan American Exposition in Buffalo and that the particular animals making these records show decided dairy form. There were ten breeds represented by 5 cows each, at the Pan American Exposition test, which lasted for six months and for profit on butter at 25 cents per pound, after deducting cost of feed, they took rank as follows: Guernseys ($230.11), Jerseys ($225.54), Ayrshires ($217.70), Holstiens ($211.04), Red Polls ($197.83), Brown Swiss ($183.08), French Canadians ($176.35), Short-horns ($172.81), Polled Jerseys ($169.61), Dutch Belted ($116.89). In order of individual profit, the Red Polls stood 2d, 14th, 30th, 39th and 40th.

We are without information as to location of breeders of Red Polled cattle west of the Mississippi river, but if there are such who have confidence in the dairy ability of the breed, we should suppose they would advertise in dairy papers, and particularly in such a paper as HOARD'S DAIRYMAN.

Starting a Milk Route.

Will you please publish in the DAIRYMAN your ideas as to the proper method to be persued by a beginner in the retail milk business? I wish to know how best to secure customers, prices usually obtainable, an explanation of the ticket system. Do retailers give credit and for how long a time, etc? A SUBSCRIBER.

Arenac, Mich.

Circumstances vary so much in different localities, that it is impracticable to submit specific suggestions covering all points. One must be governed largely by the whims and prejudices of his customers, and their ability and willingness to pay for the service rendered. One cannot afford to sell milk containing 5 per cent fat for the same price that 3 per cent milk is sold for. Neither can one afford to be at the extra expense of bottling milk and carrying it to the very door, unless he receives more for it than customers pay for milk taken from a can at the wagon.

If this inquirer can secure a few customers at first for milk of extra quality, delivered in the best condition, from cows known to be absolutely free from disease, and kept in a clean, well ventilated stable, at an appreciable advance over ordinary prices--he can afford to incur the neccessary additional expense; and if he furnishes such milk, other customers will come to him without solicitation.

There is no necessity for explaining the ticket system further than to have tickets printed in sufficient number so that no ticket shall be used a second time. It has a bad effect to hand out a soiled ticket. Have everything about the business,—tickets, bottles, cans, wagon, driver and horse and harness—clean and attractive. And do not give credit. Start in on a strictly cash basis and stick to it. Where parties buy tickets in advance, allow a small discount. For example, if milk sells at 6 cents for a single quart, sell 18 quart-tickets for a dollar.

To Make Cream Whip.

Please tell me if there is any thing that can be put in cream to make it whip, if so what is it, and how is it to be used? H. K.

Beloit, Wis.

Thin cream will not whip; warm cream will not whip. Cream for whipping should not be under 25 per cent fat and should be cooled to 40° F. or below, and should be 12 hours old. If these conditions are fulfilled, there will be no necessity of adding anything to the cream, to make it whip.

Sampling Milk at Creamery.

How often should samples of milk be taken at a creamery? J. A. S.

New Vienna, O.

Samples should be taken every day if possible, and three times a week any way.

Silo with Horizontal Girts.

Find enclosed an article cut from the "Kansas Patron and Co-operator published at Olathe, Kan., Oct. 15. Will you please criticise the silo described in the article. I have been studying the silo question for 3 years and this seems to me a method of building worth considering, and one new to me. Do you know whether this is practical? If not, why not, may I ask? Please give a discussion in the DAIRYMAN if it is worthy. F. E. U.

Gardner, Kans.

The style of silo described in the article accompanying the above inquiry has been described and fully illustrated in the DAIRYMAN many times, and is in use on the Senior Editor's farm, and on other farms in this vicinity, where it is giving universal satisfaction. There is one point in the matter of construction, advised against in the articie, that we consider of considerable importance, and that is, inserting building paper between the double lining of the inside of the silo. We consider common tar paper much better than nothing, but a much better material is the acid and water proof Giant P. & B. paper, manufactured by The Standard Paint Company, 100 William Street, N. Y., (Dept. H.)

Corn Silage for Sheep.

I would like to know if corn silage would prove a satisfactory food for sheep. I have never known of its being fed to sheep, and would like to know through your paper what has been the experience of your readers. F. R. T.

Rawley, Mass.

In his work on Feeds and Feeding, Prof. Henry says: "Silage proves an excellent food for sheep, being especially useful with ewes having lambs at foot." So far as we are informed, all who have fed corn silage to sheep, agree with this statement.

A Pennsylvania Feeding Problem.

Feed sells here as follows: bran, $21; malt sprouts, $19; brewers grains, dried, $21; wet, $4.50; cotton seed meal, $28; gluten, 23% $25; linseed meal, $30; corn meal, $27. Is the following the cheapest and best ration for good milking, 800 lb. cows?

Brewers grains, wet, 20 lbs.	.045
Cotton seed meal, 1 lb.	.014
Linseed meal, 2 lbs.	.030
Fodder stover (corn), 10 lbs	
Straw (wheat) 10 lbs	
	.089

Corn stover sells at about $10 per ton; wheat straw at $8. Have more than enough of the straw. Any criticism or suggestions you may choose to make will be appreciated. F. BROS.

Bryn Mawr, Pa.

Of the feeds named and at the prices given we consider that wet grains, gluten feed and ground corn furnish the largest amounts of digestible nutrients for a given sum of money. These feeds, if of average quality, carry digestible nutrients as follows:

	Per cent.
Bran	58.0
Malt sprouts	59.5
Dried grains	63 4
Wet grains	16 4
Cotton seed meal	73.0
Linseed oil meal	78.8
Gluten feed	80 0
Ground corn	84.3

It does not necessarily follow that the feeds mentioned as carrying the largest amount of digestible nutrients per dollar of cost would be the cheapest to feed in connection with corn stover and wheat straw, feeds especially deficient in digestible protein. The ration given contains the following digestible nutrients:

	Lbs.
Protein	1.95
Carbohydrates	9.55
Fat	.61

A ration compounded of the same roughage with 25 lbs. wet grains, 2 lbs. gluten feed and 2 lbs. ground corn, costing 2.7 cents more, would contain digestible nutrients as follows:

	Lbs.
Protein	1.82
Carbohydrates	11.54
Fat	.60

And it is by no means certain that the more expensive ration would give better results.

A Pennsylvania Ration.

Will you please give me a balanced ration for cows weighing from six to eight hundred pounds from the following feeds: Gluten feed, $1.25 per hundred; wheat bran, $1.10; oil meal, $1.50; corn, $1.20; ground oats, $1.50, clover and timothy hay and corn fodder. I also have a small quantity of roots. I have found out that individual cows have to be fed differently, but what I want you to give is an average ration. E. H.

Shinglehouse, Pa.

To such of these cows as are fresh this fall, we should be inclined to feed 1 lb. oil meal, 2 lbs. gluten feed and 4 lbs. bran, with what hay and corn stover they will eat without waste. Such a ration would tabulate about as follows:

FORMULA FOR RATION.	*Dry Matter.*	*Digestible Nutrients* Protein	Carbohydrates	Ether Extract
12 lbs. hay	10.24	.58	4.75	.19
12 lbs. stover	7.14	.20	3.89	.08
4 lbs. bran	3.52	.50	1.54	.12
2 lbs. gluten feed	1 80	.47	1.14	.05
1 lb. oil meal	.91	.29	.33	.07
Totals	23.61	2.04	11.65	.51

It is probable that some of the smaller cows will not require so much roughage, and they should have no more placed before them than will be eaten with good relish. And withal, do not omit salt every day, a teaspoonful night and morning.

Answers to Dairy Questions by Prof. Farrington.

TROUBLE IN TESTING.

"We had some trouble last Saturday in making our regular factory milk test. We have paid by the test for a long time, but never had any trouble until the last time. Our composite samples are taken by adding an ounce of milk every morning from each patron's portion to a jar, with the Scovell milk sampler. These samples are preserved by using a measureful of bi-chromate of potash. This measure is ¼ inch deep by ¼ inch in diameter. The last time we made the tests there was so much black and brown substance in among the fat that some bottles only gave 1.7 per cent clear fat. We knew there was something wrong so we cleaned the bottles again and thought it best to try the strength of the acid before we tested any more samples. We measured three samples of one patron's milk into three test bottles and added different quantities of acid to each bottle. First we filled the acid measure up to the mark; second, to about ½ of an inch above the mark; third, to about ¼ of an inch below the mark. We then finished these tests with the result that the bottle in which the least acid was used gave the clearest fat. We thought we now had the problem solved and took all the samples again and added the amount of acid which had proved satisfactory in our experiments. We were much surprised, however, to find that some of our tests still had so much black settlings in them that we could not read the fat, while others were nice and clear. This puzzles us and we would like to know if you can explain the reason for our getting this black stuff in some of the tests and not in others." J. L. W. & Co.

Random Lake, Wis.

The trouble which you have been having with testing is probably caused by the way in which you pour the acid into the milk in the test bottle. This should be done in such a way that the acid flows down the inside surface of the bottle to the bottom and collects in a layer entirely separate from the milk, which will be above the acid. When the milk and the acid are both poured into the bottle in such a way that there is no dark streak between the two liquids where the milk leaves off and the acid begins, you may be sure that the mixing of the milk and acid after this will give an even action of the acid on the milk so that a clear separation of the fat will be obtained.

If, on the other hand, the acid is so poured into the test bottle that it drops through the milk and by the time the last of the acid is poured into the test bottle, some of it has been partially mixed with the milk and a black layer of milk and acid is noticed between the two liquids, you will find that the final mixing of this acid and milk will not be sufficiently uniform to give a clear separation of the fat.

When the acid drops directly into the milk and gives a part of it a dark or black color, leaving the remainder white or in its normal condition, this shows that the strong acid has acted on part of the milk before it had time to be diluted with the entire quantity of the milk. In either case such a mixing will invariably show some burnt fat in the neck of the test bottle, it makes little difference whether you use more or less acid in each test.

The important point in this case is to do the mixing so that the acid will not

THOUSANDS HAVE KIDNEY TROUBLE AND DON'T KNOW IT

To Prove What Swamp-Root, the Great Kidney Remedy, Will do for YOU, every Reader of Hoard's Dairyman May Have a Sample Bottle Sent Free by Mail.

Weak and unhealthy kidneys are responsible for more sickness and suffering than any other disease, therefore, when through neglect or other causes, kidney trouble is permitted to continue, fatal results are sure to follow.

Your other organs may need attention—but your kidneys most, because they do most and need attention first.

If you are sick or "feel badly," begin taking Dr. Kilmer's Swamp-Root, the great kidney, liver and bladder remedy, because as soon as your kidneys are well they will help all the other organs to health. A trial will convince anyone.

The mild and immediate effect of Dr. Kilmer's Swamp-Root, the great kidney and bladder remedy, is soon realized. It stands the highest for its wonderful cures of the most distressing cases. Swamp-Root will set your whole system right, and the best proof of this is a trial.

14 WEST 117th ST., NEW YORK CITY.
DEAR SIRS: OCT. 15th, 1902.

"I had been suffering severely from kidney trouble. All symptoms were on hand; my former strength and power had left me; I could hardly drag myself along. Even my mental capacity was giving out, and often I wished to die. It was then I saw an advertisement of yours in a New York paper, but would not have paid any attention to it, had it not promised a sworn guarantee with every bottle of your medicine asserting that your Swamp-Root is purely vegetable, and does not contain any harmful drugs. I am seventy years and four months old, and with a good conscience I can recommend Swamp-Root to all sufferers from kidney troubles. Four members of my family have been using Swamp-Root for four different kidney diseases, with the same good results."

With many thanks to you, I remain,
Very truly yours,
ROBERT BERNER.

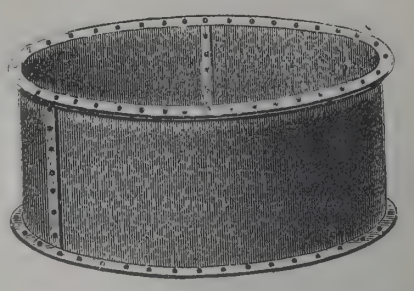
You may have a sample bottle of this famous kidney remedy, Swamp-Root, sent free by mail, postpaid, by which you may test its virtues for such disorders as kidney, bladder and uric acid diseases, poor digestion, when obliged to pass your water frequently night and day, smarting or irritation in passing, brick-dust or sediment in the urine, head ache, back ache, lame back, dizziness, sleeplessness, nervousness, heart disturbance due to bad kidney trouble, skin eruptions from bad blood, neuralgia, rheumatism, diabetes, bloating, irritability, wornout feeling, lack of ambition, loss of flesh, sallow complexion, or Bright's disease.

If your water, when allowed to remain undisturbed in a glass or bottle for twenty-four hours, forms a sediment or

settling, or has a cloudy appearance, it is evidence that your kidneys and bladder need immediate attention.

Swamp-Root is the great discovery of Dr. Kilmer, the eminent kidney and bladder specialist. Hospitals use it with wonderful success in both slight and severe cases. Doctors recommend it to their patients and use it in their own families, because they recognize in Swamp-Root the greatest and most successful remedy.

Swamp-root is pleasant to take and is for sale the world over at druggists in bottles of two sizes and two prices—fifty-cent and one-dollar. Don't make any mistake, but remember the name, Swamp-Root, Dr. Kilmer's Swamp-Root, and the address, Binghamton, N. Y., on every bottle.



EDITORIAL NOTICE—If you have the slightest symptoms of kidney or bladder trouble, or if there is a trace of it in your family history, send at once to Dr. Kilmer & Co., Binghamton, N. Y., who will gladly send you by mail, immediately, without cost to you, a sample bottle of Swamp-Root, and a book containing many of the thousands upon thousands of testimonial letters received from men and women cured by Swamp-Root. In writing to Dr. Kilmer & Co., Binghamton, N. Y., be sure to say that you read this generous offer in the Fort Atkinson HOARD'S DAIRYMAN.

As expensive buildings as these are not essential to the production of clean dairy products, but these show what the dairy business will support, as nothing but butter is sold from this farm.

act on a small part of the milk before the entire quantity is mixed with it.

I think you will find that if the acid is of the proper strength you may be sure of getting a clear and complete separation of the fat, if you carefully follow these suggestions in regard to the mixing of the milk and acid in the test bottles.

YIELD OF SALTED AND UNSALTED BUTTER.

"I have a good market for unsalted and uncolored butter and I would like to ask you if a given amount of cream will make as much unsalted butter as it will of salted butter?
Disco, Wis. G. L. D.

The relation which salt has to the amount of water in butter, is a subject that has been studied but little up to the present time. A few years ago I made some experiments at a dairy school in which we divided the granular butter which had been washed in the churn, into two lots, salted one of them, worked and made it into butter in the usual way and the other lot was worked in the same way, but made without salting it. Both lots of butter were weighed, samples taken and the finished product analyzed.

These experiments were conducted with 36 churnings and were made on a creamery scale, churning in each case from two to four hundred pounds of butter.

I noticed before making these experiments that there was a great difference in the appearance of the surface of different churnings of butter. Some would have drops of brine thickly covering the surface, while other lots were smooth, showing no moisture whatever on the surface. My investigation started out with the purpose of finding the cause of this difference in appearance, of two butters that were apparently made in the same way. The experiments I have just referred to, soon revealed the fact that the surface of the unsalted butter was invariably free from beads of moisture, while butter which was salted, showed the drops of brine very freely on the cut surface. Salt attracts the moisture of butter to itself and this accumulates in the form of drops of brine, which can easily be seen.

The results of the experiments I have mentioned, however, showed some things in relation to the amount of water left in the butter, that were interesting, besides this appearance of the surface. Briefly summarized they were as follows:

First. The salted butter in every case, contained less water than the unsalted. This was true when the granular butter from the same churning was divided into two parts and each one was washed and worked in the same way, but one was salted and the other was not.

Second. When both lots of butter were taken from the churn, partially worked and allowed to stand in the refrigerator over night, the salted butter always lost considerably more weight at the second working than the unsalted, showing that brine will work out of salted butter, easier than water out of fresh butter.

Third. The analyses taken as a whole, showed that the higher the salt contents the less water the butter contained.

Fourth. The amount of water or brine that shows on the fresh cut surface of butter is a better indication of its salt content than of the water it holds. Salted butter leaks brine easily, but the moisture will not, as a rule, drain out from unsalted butter unless it is loaded with an excessive amount of water.

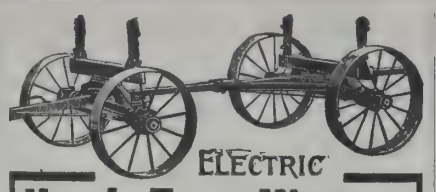
Fifth. The average amount of butter fat was nearly the same in both the salted and the unsalted lots of butter in these experiments. The amount of salt added to the fat varied from one to four per cent and we should naturally expect that the yield of salted butter would be increased by this weight of salt. It was found, however, that when the butter was weighed the salt which had been added in one case displaced about its own weight of water. You may expect, therefore, so far as salt is concerned that your yield of butter will be about the same in both cases--when you make salted butter as when you make unsalted—but the two and one-half to three pounds of salt which was added to one hundred pounds of butter in the one case will be replaced by water in the unsalted butter.

Sixth. The color of the salted butter was a darker shade of yellow than that of the unsalted.

From these experiments I think you may conclude that you ought to be able to make as much unsalted butter from a given amount of cream as you have been in the habit of making salted butter from the same cream. If your trade likes a dark shade of yellow in the butter it will be necessary for you to use a trifle more color when you come to make unsalted butter in order to bring it up to the shade that you have had in the past.

THE PRICE PER HUNDRED OF MILK TESTING 4.5 AND 3.8 PER CENT BUTTER FAT.

"I have some trouble about paying by the Babcock test in my cheese factory. Some of my patrons claim it is not right. They say there is too much difference in the price per hundred pounds of milk. I would like to know if one man's milk tests 4.5 and the other 3.8, what the difference in the yield of cheese would be and the price per hundred which these two patrons ought to be paid for their milk. Please give me the full particulars about this. A. W. S.
Veefkind, Wis.



Milk which tests 4.5 per cent fat will make more cheese than milk which tests 3.8 per cent fat. There is a difference between the two of .7 lbs. of fat in every one hundred pounds of milk, and as it has been found by careful experiment that one lb. of milk fat will make 2.6 lbs. of cheese, the difference in cheese yield between these two milks may be approximately found by multiplying the difference in test, or the .7 of one pound of fat, by 2.6 lbs. This gives 1.8 pounds of cheese in favor of the milk testing 4.5 per cent fat over that testing 3.8 per cent fat.

The best way to pay patrons by the test at a cheese factory is to take composite samples of each patron's milk, and at the end of a month or two weeks, according to the custom of the factory, figure out from the weights and tests of each patron's milk how much fat he has delivered to the factory during this time. The cheese sales during the same time will show how many pounds of cheese were made. When this cheese is sold and the expenses of operating the factory for the same time have been deducted from the money received for the cheese, that which remains is to be divided among the patrons of the factory according to the amount and test of the milk they delivered during that time. This sum of money should be divided by the total pounds of fat in the milk which produced the cheese. The quotient will give the price to be paid the patrons for one pound of fat. It is then a simple matter to multiply the fat delivered by each patron, as shown by the weight and test of his milk, by the price per pound and find out how much is due him for the milk sent to the factory during this time. An illustration of this calculation may be made as follows:

We will assume that a factory received 50,000 pounds of milk in one month and this made 5,000 pounds of cheese. The milk sheet at the receiving room may show that there were 30 patrons who brought this 50,000 pounds of milk to the factory. The weight and test of each patron's milk for the month should be found by adding together the weights and average tests.

We will assume that a patron A brought 5,000 pounds of milk during the month and his average test was 3.8. Patron B brought 5,000 lbs. of milk and his average test was 4.5. The amount of fat brought by patron A is then found to be 190 lbs.; that brought by patron B during the same time is 225 lbs. Each brought the same amount of milk, but the test was different. We must now find how much is due them for their milk which was made into the cheese sold during the month. We have already assumed that 5,000 lbs. of cheese were made. We will now suppose that this sold for 10 cents a pound, the sum realized for the cheese was then $500. The expenses of running the factory during the month may probably be $85; subtracting this from the total cheese money, leaves $415, which is to be divided among the patrons supplying the milk. We, in this case, have only the record of two patrons, A and B, out of the 30 or more who sent milk to the factory during the month. It will be necessary next for us to find the average test of the entire quantity of milk brought to the factory. We will assume that the 50,000 lbs. of milk tested 4 per cent fat. If this is the case, there must have been 2,000 lbs. of fat in the milk. In order to find the price to be paid each patron per pound of fat, it is necessary to divide the net receipts, $415, by the 2,000 lbs. of fat. The result of this calculation shows the price of one pound of fat to be 20¾ cents. The amount of money due patron A for his 190 lbs. of fat is then found by multiplying 190 by 20.75 cents. This gives $39.33. The amount due patron B for his 225 lbs. of fat is found in the same way to be $46.57, which is $7.24 more

Purity of Well Water in Butter Making.

In a recent bulletin of the Iowa Experiment Station on the keeping quality of butter, the quality of the water used in the creamery is considered as follows:

All well water, whether it be from shallow wells or deep wells, contains bacteria. Water from shallow wells is polluted with impurities to a greater degree than water from deep wells. The conditions which surround shallow wells do not guarantee a creamery pure water at different seasons of the year. Filthy surface water is all the time seeping in from the sides, especially during the wet season. In the spring of the year, or at any time during the different seasons when heavy rains are frequent, shallow, open or bored wells act as a receptacle for inflowing, nasty, surface water containing a great deal of organic matter, and where organic matter is present, germs of different species are always sure to be present.

Besides being a receptacle for such inflowing water, shallow wells serve in the capacity of traps for a number of animals, such as rats, mice, rabbits, skunks, minks and squirrels. The presence of one or more of these dead animals in an open well is sure to result in water strongly impregnated with undesirable odors and a multitude of undesirable and putrefactive organisms, which, when distributed through butter, will produce no good results. If every open well was drained and searched for such dead animals, very few would be searched in vain.

The writer has seen water used which was impregnated with impurities and bad odors to such an extent that it imparted directly to the butter this same undesirable odor and taste. The very fact that water from certain wells has a clean appearance and pure taste does not necessarily indicate that it is free from undesirable germs. Deeply-drilled wells are much the best for supplying creameries with water. They cannot in any possible way serve as a trap for small animals as can the open wells. Germs do not enter the soil so deep as to cause water to be infested with them, so the number of germs deep well water contains largely come from the atmosphere after exposure to it or to unclean receptacles.

Professor Pammel found shallow well water containing as high as 18,000 germs per cubic centimeter. Deep well water he rarely found to contain more than 400 germs per cubic centimeter.

Oregon's State Dairymen's Association.

The next annual meeting of the Oregon Association will be held at Corvallis, Ore., Dec. 15-16.

The Milk Situation in New York.

ED. HOARD'S DAIRYMAN:—Whether the Five States Milk Producers' Association ever gets control of the situation, and enables the dairymen who produce milk for consumption in Greater New York to have a hand, directly, in fixing prices and conditions, they appear to deserve that degree of success. For nearly six years they have struggled with large problems. Some say that nothing has been accomplished, but active members claim that very much has been accomplished.

One of the resolutions adopted at the annual meeting in October points to the price received for milk in 1897 and 1898, and asks comparison with the price the present year, adding: "let such comparison be the answer to all fault-finding." It is said that the advance is nearly or quite fifty per cent. That all of this can be safely credited to the work of the Association will be disputed, but it must be admitted, unless contrary evidence can be introduced, that the Association has very good grounds for a considerable portion of their claim. Agitation of the questions and the erection of co-operative creameries which, without doubt, has been stimulated by the work of the Association, have put dealers somewhat on the defensive, and have thus tended to advance prices.

Whatever it may or may not have accomplished, the Association is active and possesses vitality. The People's Pure Milk Company has not yet put up its cash for the payment of milk, and the sales committee will not consent to the delivery of milk till they do. Many believe that this will be done in time, when the financial horizon shall have cleared. A meeting of the "Five States" people with the Co-operative Creameries Association is planned for some time in January, when it is hoped that something more definite will be known. H. H. L.

Chenango Co., N. Y.

CONCERNING OUR ADVERTISERS.

PRESIDENT RECOMMENDS PRUSSIAN STOCK FOOD.

Mr. John Dey, Hortonville, Wis., President of Outagamie Agricultural Society, says: Prussian Remedy Co., St. Paul, Minn.

Gentlemen: Nearly two months ago you sent to my address at Hortonville a sample of your Prussian Horse and Cattle and Poultry Food. I have tried it in part. I have fed it to the horses and it gives them a good appetite and makes them feel good and look slick. The milk cows I have fed it to, I think my cows have a better appetite and look better and give a better flow of milk and helps the test. I have fed it to sheep and it seems to be just what they want, and I can see a change. I have not tried it on hogs or poultry, but believe it will be a great help to them. I am well pleased with it and shall use it right along and recommend it to all feeders of stock. JOHN DEY, President Outagamie County Agricultural Society, Hortonville, Wis.

P. S. I think we farmers have lost much by not knowing and using the Prussian Stock Food.

The first natural impulse, after securing the fruits of toil, is to seek some safe, profitable investment for the same. The stock market with its manipulation and fluctuations, hardly tempts the provident who see paper profits swept away, and the seeming rich reduced to poverty.

A reliable Banking House with fixed rules of business and an Interest rate of Four per cent—the limit of absolute safety—carries conviction of security and profit to all classes of investors, the farmer, wage-earner, business and professional man.

Compounded twice a year, $4.04 is earned on every $100.00 invested; and proportionately on other sums. Your investment can be increased in any amount from $1.00 up, with the privilege of withdrawals at short notice. Your account therefore, can be expanded or contracted at will, with no diminishment of earning capacity or depreciation in value. Listed stocks, bonds and mortgages are inclastic and out of your control to their full extent. There is the added expense of commissions and transfer charges which reduce the interest of 4½% and 5 per cent earned by such securities, and there is always a certain amount of anxiety and trouble in renewals and reinvestments. All this is lacking in an Investment Bank Account.

The Banking by Mail system which the Pittsburgh Bank for Savings of Pittsburgh originated seven or eight years ago makes it possible for everyone no matter where they reside to have an Investment or Savings Account with this strong old established institution, and banking can be done with the same ease and safety as residents of Pittsburgh enjoy, all of which is explained in their new Booklet mailed free with a souvenir of Pittsburgh if you will mention HOARD'S DAIRYMAN.

WIRE FENCE ON TRIAL.

Unique offer of the Advance Fence Co., made in good faith to our readers.

The Advance Fence Co., G. Sta., Peoria, Illinois, so well and favorably known to the farming public by the high quality of their wire fence and their successful advertising of fence "direct from maker to user," are now offering their fence on the thirty day free trial plan to our readers.

The responsibility of the makers and the superior quality of Advance fence make this offer one of decided interest to all concerned. The company making this fence show their confidence in their product by putting it in your hands to examine and erect, before final acceptance; Advance Fence being so good a fence that they find, from past experience with thousands of purchasers, that its merits are self-evident, and Advance Fence needs only to be seen and examined to be appreciated.

The matter of price-saving in taking advantage of their offer is also an important item to be considered by the man who wants the best fence and wants it at bed-rock factory price.

It will pay the reader to write to this firm and obtain price lists and full facts before placing any order elsewhere.

DAIRY MARKETS.

BALTIMORE MARKET.

BALTIMORE, Oct. 22.—Butter—Although there is a decided decrease in the general receipts of butter, the shrinkage is no greater than is to be expected at this particular season. So far this week the supply of extras and firsts, while comparatively light, is sufficient to satisfy the requirements of our local customers, who are very conservative in their purchases. Owing to the irregularity of the quality of our current receipts there is a wide range in values. Imitation creamery is in moderate supply; there is a good demand for all desirable stock. Fresh, sweet ladles are in quick demand; the supply of this kind is light. Packing stock is in moderate receipt; there is a quick sale awaiting all good to choice arrivals. Choice to fancy blocks and prints are in good request. The market in general closes steady and quite firm at the recent advance.

Creamery separator, extras, 22@22½c; firsts, 20¼@21½c; seconds, 18@20c; imitation creamery, extras, 19c; firsts, 17@18c; seconds, 15@16c; Iowa & N. W. Ladle, extras, 16½c; firsts, 15½@16c; seconds, 13@14c; Ohio & Indiana Ladle, extras, 16@16½c; firsts 15@15½c;; seconds, 13@14c; creamery blocks (2 lbs.), extras, 23½c; firsts, 21½@22½c; seconds, 20@21c; creamery prints, (½ lbs.), extra, 24½c; first, 22½@23c; seconds, 20@21c; Md. Va. & Penna. prints, extras, 23c; firsts, 20@22c; seconds, 17@19c.

Eggs—With less liberal receipts and a better inquiry, particularly for strictly choice stock, there is a steadier feeling, and our market closes in good shape on all desirable offerings, both of fresh and storage stock at 23 cents.

301 Exchange Place. G. M. LAMB & BROS.

NEW YORK MARKET.

NEW YORK, Oct. 24—Butter—Receipts for the week, 36,181 packages. Exports for the week, 1,278 packages.

The arrivals this week of real fancy, fresh make creamery butter were much lighter, and buyers had to do some shopping to supply their wants; this lead to a firm market and latter part of the week price was advanced to 22c. The shortage of fancy, fresh goods made more inquiry for best marks of freezer butter and sales were made in a small way of exceptionally fancy August and September makes at 21 to 22c. Finest fresh dairy and Imitation creamery makes find ready sale at full prices; most of these styles butter arriving are poor and have to be sold at 15 to 17c. A few parcels of ladle butter sold for export at about 15 to 15½c, and low grades packing stock at 14 to 14½c. Nothing doing in renovated goods. We quote:

Creamery, extra, 22c; medium, 20@21½c; poor, 16@19c. Dairy, extra, 20@21c; medium, 16@18c; poor, 14@15c.

Cheese—Receipts for the week, 25,243 boxes. Exports for the week, 5,300 boxes.

Exporters bought a few fancy full cream cheese at about 11½ and paid 8 to 10c for finest, light skims and took full lines of poor skimmed cheese at 3 to 4c.

Home trade were only moderate buyers and while they were willing to pay 11½c for finest small and large cheese, they declined to pay prices asked by receivers, say 11¾ to 12c. At the close there is a better feeling in all grades cheese with a tendency to higher prices. We quote:

Full cream, extra, 11¾c; medium, 11@11½c; poor, 8@10c.

Eggs—Receipts for the week, 44.742 cases.

There is not enough of new laid eggs arriving to supply the trade, and price for this kind of stock is much higher than our quotations. All grades of eggs are in better demand at better prices. We quote:

New York & Pennsylvania, finest, fresh, per doz., 27@28c; Northern & Western, finest, fresh, 26@27c; all sections, poor to good, 18@25c; refrigerator stock, 18@22c.

177 Chambers St. DAVID W. LEWIS & CO.

SAN FRANCISCO MARKET.

SAN FRANCISCO Market Oct. 22—The market for butter displayed a steady tone yesterday on the upper grades of creamery offerings, and the demand, while not brisk, was sufficiently liberal to absorb the bulk of available supplies at full figures. Trading in the cheaper butter, however, continued disappointing, but prices were as previously quoted. For storage goods the market showed a firm tone and active trading was reported within the quoted range of prices. The light arrivals of ranch eggs and the briskness of the demand caused a further improvement in the demand and a 2 point advance was effective in values for selected offerings. Storage eggs naturally shared in the improvement and there was a general hardening of values for both local and eastern descriptions. The demand was buoyant throughout the day and the market closed firm, with a marked upward tendency apparent. Cheese was without quotable change.

Receipts yesterday aggregated 44.000 pounds butter, 683 cases eggs and 4200 pounds cheese.

Butter—Creamery, extras, 29@30c; good to fancy, 26@28c; dairy, extras, 24@25c; dairy, choice, 22@23c; store, 18@20c: California storage, 24@27c; eastern creamery, 23@25c.

Cheese—California creamery, mild new, extra, 14@15c; mild, new, choice, 13½@14c; Young America, 14@15½c; eastern, New York, Cream, Cheddars and Flats, new, 14½@16c.

Eggs—Ranch, selected large, 52@53c; good to choice, 45@50c; store, nominal; California storage, 30@33c; eastern, 25@30.

Cream Separators

Made in 1904.

Now is the time to make sure of getting your share of them.

The De Laval Separator Co.

Randolph & Canal Sts., CHICAGO.
1213 Filbert St., PHILADELPHIA.
9 & 11 Drumm St., SAN FRANCISCO.

GENERAL OFFICES:
74 Cortlandt St., NEW YORK.

121 Youville Square, MONTREAL.
75 & 77 York Street, TORONTO.
248 McDermot Avenue WINNIPEG.

For Sale—Creamery plant doing fine business, with rooms for family; large barn, in beautiful village with high school and in best dairy district on Puget Sound. Price $2.300 cash. Address E. I. THOMPSON, Everson, Wash. 35-4

For Sale—480 acres, 200 level, 160 acres Gov. land can be added by using homestead right, making 640 acres in one piece. A well equipped dairy of 30 cows, with gas engine; 40 acres fine grove, plenty water in grove. Good buildings, very rich soil; called the finest outfit in the country. Give possession any day and give ones own time to pay for last half, if ten years; terms at 6 per cent. I mean business. $9,600 is the price, you will say it is worth $14,000. Address F. A. I. R., care Hoard's Dairyman. 30-tf

Herdsman Wanted—Who understands care and handling of thoroughbred Holsteins as well as rearing of young stock. Single men only need apply. State wages and experience. Steady place for right party. Address A. J. DOUGHERTY, Streator, Ill. 34-tf

For Sale—A cheese factory in good dairy country, doing good business. No opposition, (cheap.) Address S. O. U., care Hoard's Driryman. 34-tf

For Sale—Two registered yearling Guernsey bulls. RAY BICKNELL, Ft. Atkinson, Wis. 32-tf

Wanted—Position as superintendent of dairy farm within 125 miles of Chicago. Thoroughly up-to-date in all branches of farming. Have a market for high grade milk and cream at good prices. Address A. X., care Hoard,s Dairyman. 38-2

Foreman Wanted—A first-class dairyman, with knowledge of general farming can get position at once as foreman on my farm near St. Paul, Minn. State whether married or not. E. H. HOBE, New York Life Bldg., St. Paul, Minn.

Position Wanted—On a first-class dairy by a married man 30 years of age. Small family. Good milker and all round experienced man. Wages $35.00 per month, house, milk, garden, etc., furnished. Can come at once. Address DAIRYMAN, 800 So. East 8th, Des Moines, Ia.

Wanted—A first-class hand on dairy farm. Must be a good milker and sober. Wages $25.00 per month with board and a chance of increase. JOHN S. EVANS, Grafton, W. Va. Route 5.

For Sale—Two Holstein bulls ready for service. Also younger bulls. Prices $25.00 to $75.00. All stock registered. H. GLISSMAN, Sta. B., Omaha, Neb.

Wanted—A partner in a bottled milk business in some American city in the East or Middle West. Could supply a lot of modern, up-to-date machinery necessary, or would sell machinery. Correspondence invited. References exchanged. Write quick. Address C. H. McNISH, Lyn, Ont., Can. 37-2

For Sale—One carload of Jersey cows. Thoroughbreds and grades; also a few Holsteins. For particulars and specifications address BYRON PARSONS, Havana, N. D. 35-4

For Sale—Choice pedigreed O. I. C. Pigs 12 weeks old at $8.00 each. S. J. HOWARD, R. F. D. No. 1, Henderson, Ky. 36-3

For Sale—One fine registered 18 months Guernsey bull. Address EDWARD DIETZ, Hyde's P. O., Md. 36-3

For Sale—Not wishing to inbreed we offer for sale our bull, De Kol Duke, grandson of Butter Boy 2nd. Also, 2 young bulls, one fit for service. E. W. MOORE, Spring Creek, Warren Co., Pa. 38-2

Wanted—Experienced butter and cheese maker wants position, address "BUTTER MAKER," P. O. Box 373, Morenci, Mich. 38-2

Wanted—Butter and cheese maker of 25 years experience in U. S. and Canada would like a position in either creamery or cheese factory; prefer Pacific coast. Address A. W. W., 679 Arkwright St., St. Paul, Minn.

Wanted—Experienced butter maker, former instructor in dairying, at present in charge of sanitary milk bottling plant in eastern city, wishes to change position. Address C., care of HOARD'S DAIRYMAN, Fort Atkinson, Wis. 38-5

Wanted—Experienced herdsman for a milk farm. Applicant must state age, experience, references and wages wanted. JOHN D. WALSH, Mont Clare Station, Chicago, Ill. 38-4

Closing Out—25 high grade Jersey cows, 3 to 6 years old. Fresh to forward springers. For particulars, ROCKY RUN CREAMERY, Wyocena, Wis.

Wanted—Position as manager of dairy or stock farm. Experienced in intensive farming. Was for years a herdsman; well educated; good habits; good references. Address, S. C. H., care HOARD'S DAIRYMAN.

Wanted—Good milker and butter maker. Man capable of taking entire charge of small herd of thoroughbred Jerseys. Must have had experience in raising calves. Steady employment at good wages for competent man. M. E. REEDER, R. F. D. No. 2, Muncy, Pa. 37-2

For Sale—3 Scotch Collie puppies 7 months old; old male sable and some white; sire and dam registered. Also 4 Holstein bull calves 3 to 8 months old; sire, Sir Dairy B. M. DeKol, and out of choice cows. HENRY WALSH, Sheboygan Falls, Wis. 37-4

For Sale—A 2-year-old registered Jersey bull and a registered Jersey cow soon to drop her 4th calf. These are fine animals. Address JAMES M. ROGERS, Elsberry, Mo. 37-2

Wanted—Position by capable butter maker of 15 years experience in creamery in R. R. town, married. Use no liquor or tobacco. Address COMPETENT, care Hoard's Dairyman. 37-3

The Third Revised Edition of Buff Jersey's Popular Book Just Out of Press—Ten chanters, 25 illustrations and right up-to-date. Subjects treated are: Silos and Ensilage. All Phases of the Dairy Subject, Soil Crops. Up-to-date Farm Machinery. How to Cure Abortion and Milk Fever. Some Medicines and Remedies. The Steam Plant, its care, and many other valuabe things ably treated. Send for circular. Sent post paid, cloth binding $1.00, paper 75c. BUFF JERSEY, Monmouth, Ill. 47-tf

Excursion Tickets to St. Paul and Minneapolis and Return—Will be sold by the North-Western Line daily until Nov. 30, 1903, from Fort Atkinson at $14.00 for the round trip, limited to return until Dec. 15, 1903. Apply to agents Chicago & North-Western R'y. 35-8

Two choice young Guernsey bulls for sale. MRS. A. W. LEHMANN, Neosha, Dodge Co., Wis. 12-sp

Some Questions in Dairy Feeding.

[Paper by PROF. HARRY HAYWARD, at the New Hampshire Dairymen's Association.]

During the past ten or twelve years, the literature on the care and feeding of dairy cattle has increased rapidly. Nearly every phase of dairy management has been investigated, in one way and another, and the results of these investigations, published in our station bulletins and agricultural papers, have been widely scattered among reading, thoughtful farmers.

As might be well expected, there are but few of the many questions bearing on the dairy business which have not been settled several times and in a way so different each time as to leave some of them still unsettled.

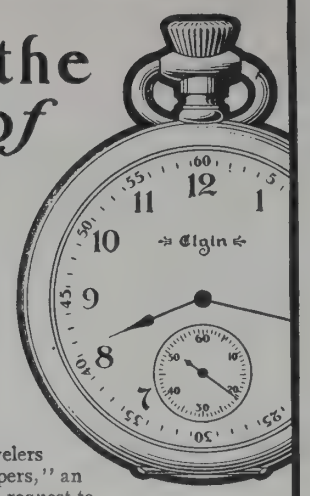
My purpose to-day is to go over a few of these points with you, hoping that what I have gathered in my experience, as a dairy teacher and experimenter, may be of some help to you, and that I may gather from your discussions something that will be of benefit to me.

I wish to take up first a point that is of great importance to all winter dairymen who are compelled to buy large amounts of nitrogenous by-products to feed, a point upon which most of our leaders in dairy thought are modifying their views considerably. I refer to the influence of the nutritive ratio of the ration upon the economy of the milk and butter production, or, in other words, the economy of the so-called "balanced" ration.

For the past fifteen or twenty years the dairyman has been struggling to feed a balanced ration, buying expensive feeds to enable him to give his cow from 2.2 to 2.5 pounds of digestible protein. Later experiments have demonstrated that a ration, less expensive and more completely home grown, will produce just as much milk and butter. Carefully conducted experiments at the Pennsylvania Experiment Station showed that, other conditions being equal, between the limits of 1:4 and 1:12 the nutritive ratio had no effect either upon the quantity or quality of the milk produced. It has been thought that a surplus of protein over and above that required to supply the waste of tissue and to furnish the amount required by the milk had a stimulative effect upon the milk secreting organs of the cow. In the experiments made at the Pennsylvania Station digestion trials were made, and the results obtained showed the amount of protein fed, over and above that required for maintenance and that taken up by the milk, passed off in the urine with no apparent effect upon the cow in any way. While these experiments were carried on during periods of six months each year for three years, they cannot be taken as conclusive, further work under somewhat different conditions being needed, but they certainly indicate that we have been feeding more protein and, in consequence, a more expensive ration than is now considered necessary.

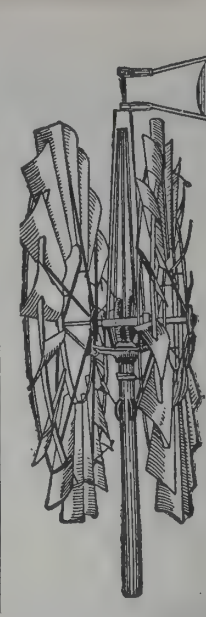
However, it is evident that a certain amount of nitrogenous food must be fed besides what we can raise in ordinary farm crops, and I know of some prominent dairymen who believe that they must feed certain foods in order to get the best results, or, in other words, they think the cow will not do so well on buckwheat middlings, for example, and corn-meal, as she will on bran and corn-meal. As a result, there are times when the particular ration they wish to feed costs them more than if they could make up a ration of the same composition with other and cheaper foods. While there is no question but that certain foods have certain desirable effects upon the animal system, I fully believe that the effect produced by any single food can also be produced by some other food or combination of foods. A number of experiments have demonstrated that, when fed as part of a well compounded ration, foods of similar composition and digestibility are equal in productive energy. This fact will then be of material assistance to us in selecting the grains to be bought for a season's feeding.

The necessity of adding purchased protein to our home grown feeds to make a suitable dairy ration has resulted in a great effort to produce the needed protein on the farm upon which it is fed. Considerable has been done in various parts of the country with cow peas, soy beans and alfalfa, but, to my knowledge, nothing has as yet been satisfactorily produced on the farm that will take the place of such foods as cotton seed or gluten meal or even bran. After the experience of last year, when all kinds of feeding stuffs were so exorbitantly high, any possibility of escaping from the grain dealer will be gladly considered.



Last year I had considerable experience in feeding a by-product of dairying in the form of a skim milk powder known as Nutrium. While working with this form of skim-milk in some experiments in calf feeding, the thought suggested itself that the skim-milk product known as dried curd, or casein, might be successfully fed to dairy cows as a concentrated nitrogenous food. As you all doubtless know, adding sulphuric acid to skim-milk at a temperature of about 120° F., coagulates the casein so the whey may be drained off. The curd is then dried for about twenty-three hours at a temperature of 120°F. The resulting product, when pulverized, closely resembles white corn meal. It contains about 75 per cent of protein, or nearly twice as much as cottonseed meal. It is easily and cheaply made, will keep indefinitely, and is rich in protein. A ration composed of 10 lbs. mixed hay, 35 pounds silage, 5 pounds corn meal, and 1½ pounds dried curd would conform closely to the feeding standard and have a nutritive ratio of between 1:6 and 1:7. In other words, it looks on paper like an ideal ration and would compare favorably in cost with a ration composed of 10 pounds hay, 25 pounds silage, 4 pounds corn meal, 3 pounds bran, and 2 pounds cotton seed meal. I have fed enough of this dried curd as part of a mixed ration to know that the cows will eat it, that it has no apparent ill effect upon the animal, and a casual observance would seem to indicate that it sustains the flow of milk. Of course, the feeding of dried curd is not recommended, but is suggested as worthy of investigation by those why pay heavy feed bills, and who have a good supply of skim-milk.

Another question perhaps worthy of consideration in dairy management, is the number of times cows should be fed and watered during the day.



I have worked in a large herd where we fed the cows five times a day. I have also worked with other herds which were fed but twice a day, and I know the cattle were quieter, more contented, and I believe gave better results than when they were fed oftener. When cows are fed a number of times during the day they are up on their feet, straining and worrying for the feed some time before it gets to them. Careful, accurate investigations have recently taught us that an animal is using energy when standing upon its feet that might be put to some other use if lying down. Ruminants have large stomachs and the more quickly this stomach is filled and the animal lies down, contened and satisfied, the better the returns will be for its owner. Another consideration in favor of feeding but twice a day is the expense of the labor required for feeding oftener. It is well understood that it will cost less, and be more convenient, in most cases at least, to feed a given amount in two feeds than in three or five feeds.

The matter of providing water for stall-fed cows is one that has provoked a great amount of discussion, comparatively little of which has been based upon actual figures. Much has been said and written about the advantages of having water before the cow at all times in the stable. A great deal of this has seemed so plausible that little has been said against the practice. If, however, the disadvantages are

Water In The Stable a Necessity.

It is universally acknowledged that stock in the stable should have constant access to water of suitable temperature, and all progressive Dairymen are putting in some form of Watering Device. Why not use the Best? Write for descriptive circular.
C. E. BUCKLEY & CO., Poughkeepsie, N. Y.

KEEP HOARD'S DAIRYMAN IN A FILE.
It preserves each copy and keeps them handy for reading and reference. We buy these binders in large lots and sell them to our readers for just what they cost us. We want you to have them. We will send a heavy Manilla Binder with cloth back, postpaid, for 30c, or will send for one new subscription (not your own.) We will send a strong, handsome Binder, very serviceable, postpaid, 60c, or will send for two subscriptions (your own subscription and one new one will obtain this.)

carefuly weighed against the advantages, it will be seen that there is at least a question as to whether the outlay necessary to put in a self-watering plant, will repay even a low rate of interest on the dollars and cents invested. In the first place, three experiments conducted at two different Experiment Stations, show no increase in milk or butter where the cows were allowed water at will, as against having it twice a day in two experiments, and once a day in one experiment. If these experiments can be relied upon, they indicate that as a proposition to increase the productivenes of a cow, the self-watering devices must be at least questioned.

In the second place, in some cases it is next to impossible to tell when a cow is in season unless she is turned out of doors with other cows. This may, and frequently does cause serious inconvenience and loss in a dairy, and should not be overlooked in casting up the pros and cons of this question.

In the third place, it is admitted by nearly all dairymen that it is almost necessary for the health of the cow that she have at least a little exercise each day, and while a cow is out of the stable there is seldom any reason why she should not take the opportunity to drink.

In the fourth place, I have seen a number of self-watering devices either get out of order and require frequent repairing or not work satisfactorily, so that water had to be carried in pails to supply the deficiency.

In my opinion, based upon considerable observation and some experience, all things considered, a watering trough arranged if possible under a shed in a yard, where it can be supplied with fresh water once a day in winter and twice a day in summer, is more economical, more convenient, and, on the whole, more satisfactory than a self-watering device in the cow stable. Whether it will pay to warm water for cows in winter is also a question that has been debated pro and con for many years. I feel quite safe in saying, in view of the reliable data uppn the question, that for cows kept in comfortable barns there is but little, if any, advantage in warming water they drink.

These three points of feeding, and the number of times per day a cow should be fed and watered are mentioned because it seems that most dairymen should be able to reduce the cost of production in one of these places. That the cow is a highly organized animal we all admit, but it takes more to get her out of adjustment under rational treatment than many would have us suppose.

On dairy farms where either milk is is sold or butter made, it is often a perplexing question to know what is the best way to dispose of the calves. In some cases they are deaconed, in others, sold for fifty cents or $1.00, and in some cases, given away. In this connection, I wish to call your attention to the results of some experiments in which was determined the value of milk and butter when fed to young calves, for the production of veal.

The American dairyman does not pay the attention to raising veal that some of the dairymen do in Europe, and as a consequence does not produce veal of nearly so fine a quality as the Dutch farmers. There is every reason to believe there is an opportunity to create a well paying demand for a superior quality of veal. A few years ago the Pennsylvania Station conducted two different experiments to determine, if possible, what the relation was between milk sold, or made into butter, and that made into veal. The results obtained in the two experiments agreed so closely that they have a fair degree of reliability.

The calves, sixteen in number, were confined in darkened stalls so narrow that after a few days they could not turn around, and care was taken that they had absolutely no solid foods. The object was to keep them as quiet as possible and to stuff them with all the whole milk they would take twice a day.

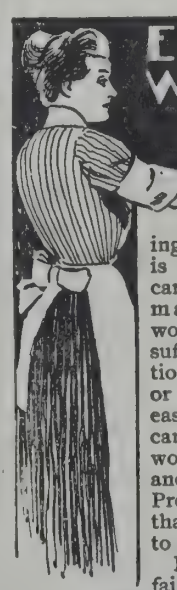
The calves used in these experiments were very poor for the purpose, and as a consequence the results obtained were not so good as if a higher class calf had been used. However, the results were so surprising to me that they may possibly be of interest to you.

It was found that when veal calves were sold at four weeks old for five cents a pound, shrunken live weight, they would pay a gross price of $1.41 per cwt. for milk testing four and two-tenths per cent fat, and twenty-eight and one-tenth cents per pound for butter: when sold for six cents per pound, $1.70 per cwt. for milk or four and two-tenths cents per quart, and thirty-four cents per pound for butter.

When fed until seven weeks old and sold for five cents they would pay ninety-three cents per cwt. for milk and nineteen cents for butter, and if sold for six cents, $1.18 for milk and twenty-four cents for butter. In either case the figures are as good, if not better, than average net market prices for milk and butter, and the practice of vealing surplus calves is worthy the consideration of all thoughtful dairymen,

The last point in dairy management to which I wish to call your attention, and especially those dairymen who ship milk, is that of raising calves from your best cows without any milk, or at most very little, beside the colostrum from its own mother.

The advantages to be derived from rearing one's own calves, briefly mentioned are as follows: 1. In no other way can the standard of production be systematically raised and maintained. 2. In no other way can uniformity in a herd be secured. 3. The danger of bringing disease into a healthy herd is reduced to the minimum.



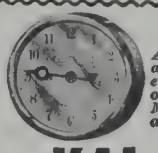
The difficulty of raising calves without skim milk has been almost insurmountable, owing to the lack of milk substitutes and to the high price asked for the various calf meals upon the market. During the past year the Pennsylvania Experiment Station conducted feeding trials with a home-made calf meal for young calves. The results were promising indeed and briefly stated were as follows:

1. Seventeen calves were successfully raised, consuming on an average but 121 pounds of milk. The salable part of this 121 pounds at five cents per quart amounting to $1.25 or less.

2. But little difficulty was experienced in raising the calves, although the conditions under which they were kept, were not satisfactory.

3. The calves raised on milk substitutes made just as rapid and satisfactory growth, determined by the scales, as the check calves fed upon a skim milk and grain ration.

4. The total cost of raising calves on milk substitutes up to the age of four months, or when they are ready to be

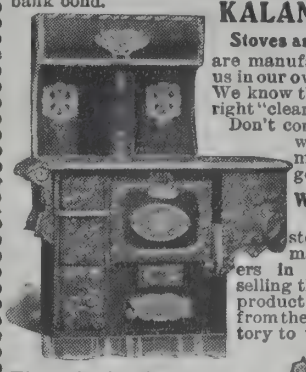


"Love lightens labor," the saying runs, and in a sense it is true. But even love cannot lighten labor or make it easy for the woman who is in constant suffering from inflammation, bearing-down pains or other womanly diseases. The one thing that can make work easy for women is sound health, and Dr. Pierce's Favorite Prescription is the thing that will give sound health to sick women.

Dr. Pierce has so much faith in his "Prescription" that he offers to pay $500 in legal money of the United States for any case of Leucorrhea, Female Weakness, Prolapsus, or Falling of Womb which he cannot cure. All he asks is a fair and reasonable trial of his means of cure.

"I suffered from female weakness for five months," writes Miss Belle Hedrick, of Nye, Putnam Co., W. Va. "I was treated by a good physician but he never seemed to do me any good. I wrote to Dr. R. V. Pierce for advice, which I received, telling me to take his 'Favorite Prescription' and 'Golden Medical Discovery.' When I had used the medicines a month, my health was much improved. It has continued to improve until now I can work at almost all kinds of housework. I had scarcely any appetite, but it is all right now. Have gained several pounds in weight. Dr. Pierce's medicines have done wonderfully well here. I would advise all who suffer from chronic diseases to write to Dr. Pierce."

"Favorite Prescription" makes weak women strong, sick women well.



Dr. Pierce's Common Sense Medical Adviser is sent *free* on receipt of stamps to pay expense of mailing *only*. Send 21 one-cent stamps for the paper-covered book, or 31 stamps for the cloth-bound volume. Address Dr. R. V. Pierce, Buffalo, N. Y.

All Kalamazoo ranges and cook stoves are equipped with patent oven thermometer. Makes baking sure and easy.

The KALAMAZOO

A better stove or range than you can get from any other source. A saving of from 25% to 40% in price. Prompt shipment from factory to user. Factory prices—no dealers' profits. Freight prepaid by us. 360 days approval test. Guarantee backed by $20,000 bank bond.

KALAMAZOO

Stoves and Ranges are manufactured by us in our own factory. We know they are all right "clear through." Don't confuse them with cheap mail order goods.

We are the only stove manufacturers in the world selling their entire product direct from their own factory to the user.

There isn't a better stove or range at any price and by eliminating all dealers' and middlemen's profits we save you easily 25% to 40%. Moreover we give you a 360 Days Approval Test. If your purchase is not satisfactory in every way, return the goods at our expense. We have a complete line of ranges, cook stoves and heaters for fuel of all kinds. All stoves blacked, polished and ready for business.

It will pay you to investigate.

Send for catalog No. 163 and prices, freight prepaid.

The Marvin Smith Comp ny announces the completion or their new Merchandise Ca'alogue for the season of 1903 4 and invite everyone to send for it. The catalogues of this compa y always have an individuality and attractiveness that no others seem to possess They are always spicy and full of interest. Everything is presented in a manner that pleases and their new No. 44 catalogue certainly outranks anything in the catalogue line. Every article they list is shown in a large picture, and with their clear full and minute descriptions, you practically see, and fully understand the goods, and can make selections and purchases from it as satisfactorily as you could by a visit to their store, and examining the goods. This company is noted for the reliable quality of goods they carry and this, with their astonishingly low prices and straightforward business methods, has won for them the first place in the Mail Order business. We show a picture of their No. 44 catalogue, which may be obtained free.

No householder should fail to get one of these catalogues, no matter whether he wishes to deal with the house or not, as it contains entertainment and valuable information for every member of the family. There is no family so small that they cannot make a saving of a snug little sum annually by making use of the information in this book. It is printed in one large volume, as shown by the illustration above. The cost of placing this book in your hands, including paper, printing and postage is about 65c. It is absolutely free, and will be sent to any subscriber of this paper who fills out the blank below and enclose 15c in stamps, merely to help pay the postage. This book is also printed in eleven departments, so that if you are interested in only one class of merchandise you can get a catalogue treating on that class alone, without sending for the large book. The following department catalogues, issued by the Marvin Smith Company, will be mailed free.

Catalogue A, Agricultural Implements. Catalogue B, Shelf Hardware, Builders' Hardware, Carpenters' Tools and a full line of kitchen utensils. Catalogue C, Blacksmiths' Tools and Supplies. Catalogue D, Stoves of every variety and description. Catalogue E, Harness, saddelry, blankets, robes, etc. Catalogue F, Clothing for men, women and children. Catalogue J, Trunks, satchels, valises, etc. Catalogue L, Sewing Machines of every kind. Catalogue P, Cutlery. Catalogue R. Shoes of every kind for men, women and children.

Any of the above catalogues will be sent to any subscriber of this paper free of charge, and to obtain a copy of any one of the above catalogues, simply fill in your name and postoffice address in the blank space below, cut this article out of the paper, and indicate the catalogue you want by marking "X" opposite of the catalogue desired. Mail this to the Marvin Smith Company, Chicago, Illinois, and they will send the catalogue to you by return mail, postage paid.

We however, really advise that you send and get the large complete catalogue. This book contains everything described in all of the catalogues mentioned above and thousands of other items too numerous to mention. If you want the large book, you should fill in your name below and enclose this article with 15c in stamps, addressed to the Marvin Smith Company, Chicago, Illinois, and they will send the large complete No. 44 catalogue to you, postage prepaid. The 15c is only to help pay the postage.

Or, if you see an advertisement of the Marvin Smith Company, in his paper for any goods you want, and you order direct from the advertisement, and you want the large catalogue sent with the goods, fill in your name below, cut this article out and send it with your order, and the large catalogue will be sent with the goods free In this case it is not necessary to send the 15c to pay the postage.

We suggest that before you lay this paper down you refer to the advertisements of the Marvin Smith Company, and see if they have advertised anything in this paper which you would like to send for. If they have, send the order to them for the goods you want, and have them send one of these complete books with the goods, but if there is not anything advertised in this paper that you wish to send for at once, we advise that you at least fill in your name below, and have them send you the free department catalogue which you are interested in, or the large complete catalogue.

However, the large complete catalogue is what every subscriber of this paper should have, as it will tell you what you should pay for everything that you buy and thus be a big saving to you.

Remember, that to get any of the department catalogues mentioned above all that is necessary to do is to fill in the blank space below, cut this article out, send it by mail, and the catalogue desired will be sent free.

put upon a hay and grain ration, did not exceed $10 per calf.

5. The calf meal was composed of 30 pounds wheat flour, 25 pounds cocoanut meal, 20 pounds nutrium, 10 pounds linseed meal, 2 pounds dried blood.

DISCUSSION FOLLOWING PAPER OF PROF. HAYWARD.

Question: Don't you think it would be better to warm the water?

Prof. Hayward: If the cows were well stabled, I don't believe the difference would amount to a row of pins, measured in dollars and cents. I can imagine conditions where cows are kept in cold stables and fed a large amount of poor, watery silage, that they might do better if given warm water instead of cold, but if fed hay I don't think it would make any difference.

Question: Do you believe in boiling feed for cows?

Prof. Hayward: No, I don't. I believe experiments have shown conclusively that it does'nt pay in dollars and cents to warm or boil and feed cow slops.

Question: Do you water morning or evening?

Prof. Hayward: Our practice has been usually morning, because then the cows go out and stretch their legs and the stables are cleaned out and aired, and then they are put back for the day.

Question: Do you feed the concentrated foods before or after milking?

Prof. Hayward. We always feed our concentrated foods the first thing in the morning before we milk, then milk, then feed the coarser foods. After milking at both times we feed our roughage. That has the advantage of not feeding rough or dusty foods during the milking, so the stable will be free from dust and the milk will be free from any bacteria that might fall into it during milking.

Question: Will it affect the flow of milk to feed the cows grain while they are being milked?

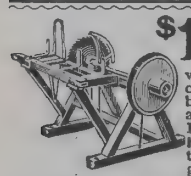
Prof. Hayward. It is a question I haven't any data on. Personally I don't think it is a good practice. I wouldn't want to do it. I will ask Prof. Wing.

Prof. Wing. I don't think it would make any difference. I don't mean that in any particular case it wouldn't make a difference. I mean taking all the cows. It will depend on what the cow is used to more than on the mere fact of whether she is fed before she is milked or while she is being milked.

Question: In the question of veal, would'nt it be better to make veal and make butter, too?

Prof. Wing. I don't believe you can make veal very successfully on skim-milk and grain. I don't know of any one who is doing it very successfully. Skim-milk calves are reported quite a little below prime veal in all markets. A calf has got to be good for veal sooner than he will eat sufficient grain to do him very much good. Of course they will begin to eat before four weeks old, but they are only getting used to it then. You would have to keep a calf three or four weeks more to see the effect of grain. That tallies exactly with our experience with lambs. We cannot fatten lambs except on milk, and the less they eat aside from that the better. You want to get them into market before they eat very much.

Question: How would you raise a calf for future dairying?



Prof. Wing: Raise it on skim milk. I don't believe the fat put on them cuts much figure as far as the future usefulness of the cow is concerned.

From a Minnesota Dairyman.

A Cream Query—An Unsatisfactory Yield—A Feeding Problem.

ED. HOARD'S DAIRYMAN:—I have only been in the dairy business since last January and would like advice as follows:

First, since I began dairying I have sold my cream to our local creamery at

$13.25 for this **Tilting Table Wood Saw.** Saws any kind of wood. The frame is made of the very toughest seasoned oak, shaft of cold rolled steel, set in extra long boxes carefully babbitted, all casting and wrought iron parts extra heavy. In addition to the regular bracing **we have added** a heavy cast iron brace, tieing the four upright timbers together. This is a feature not used on any other machine. It adds strength and with this construction **THE FRAME IS SOLID AND STEADY,** balance wheel is heavy, weight of machine is 330 lbs. Made to drop wood to right or left. **We guarantee** this machine to be the strongest and best saw frame made and if you don't find it equal to machines retailed for $20.00 to $35.00 and all we claim for it, return at our expense. **Price 24 in. saw, $5.20; 26 in., $6.00; 28 in., $6.80; 30 in., $7.60. Don't buy a saw of any kind until you get our new implement catalog. It tells all about speeding saws and gives all kinds of information. It's the most complete book on implements ever printed. CUT this ad out and send it to us and we will mail the catalogue FREE.**

Just for Nothing

We will send you THE JERSEY BULLETIN and HOARD'S DAIRYMAN to the end of 1903. But while making you this generous offer, we wish you to do something.

Subscribe for both papers for 1904, at the lowest clubbing rate, $1.75 FOR THE TWO. To make it plain, send us $1.75 and we will send THE JERSEY BULLETIN and HOARD'S DAIRYMAN to January 1st., 1905.

☞ For Sample Copy of Jersey Bulletin address Indianapolis, Ind.

"IT'S UP TO YOU!"

an average price of 20.6 cents per pound for butter fat. I am now offered 40 cents per gallon for 20 per cent cream. Which is the better proposition?

I have a herd of 17 cows, most of them are four coming five years, with their second calves; five of them are three coming four, just about to freshen. They will average from 800 to 900 pounds in weight. Four of them are full blood Jerseys and the rest are grade Shorthorns. Since January 1st to Oct. 1st, this herd has produced 2129.8 pounds of butter fat.

The reason for giving the above data, is that I want your advice as to feeding this herd for the best results, with the following feeds: Our hay crop is a complete failure, which leaves nothing for rough feed but fodder corn, cut in the usual way, and rye straw. Bran is $16.50 per ton, oats, 30 cents per bushel, corn 35 cents per bushel and oil meal $25 per ton. Will it pay to feed my cows corn just as it was cut in the shock or had I better husk the corn? What is a ton of husked corn stalks (cut in good time) worth?

I have just completed a dairy barn for my cows and calves, fitted out with Bidwell stalls, King's system of ventilation, and well lighted and fitted up to date, and now I am very anxious to learn all I can about my business. I have read your paper for three years and all I know about cows I have learned from its pages.

Thanking you for your advice which you gave me some time ago as to planning my barn, I am Yours truly,

Becker, Minn. J. C. WAGNER.

A gallon of 20 per cent cream will weigh approximately 8½ lbs, and contain 1.7 lbs. of fat, which at 20.6 cents per pound would come to 35 cents. All other things being equal, it would be more profitable to dispose of this cream at the offer made, which is at the rate of 23½ cents per pound of fat. Of course no one can tell whether butter will advance in price next year.

We do not consider a yield of 2,130 lbs. of fat by 17 cows in 9 months as at all satisfactory, as it is at the rate of less than 170 pounds per cow for a full year, unless the remaining three months are better than the average for the balance of the year.

The presumption is that some of these cows are not paying for the feed they consume. The proper course to pursue is to commence at once to keep an accurate record of what each cow produces. Get a spring balance and hang it at some convenient place in the stable and weigh the milk given by each cow night and morning.

Make a permanent record of their weights on blanks, which may be ruled at home for the purpose, or purchased from this office. Near the middle of each month make a composite sample of each cow's milk, to include at least four milkings, and have this sample tested for butterfat. This test may be accepted as the average for the entire month, unless it should appear to be abnormally high or low, for some particular cow or cows, in which case take another composite sample and have that tested.

Transfer from the loose milk sheets into a regular book account with each cow, the total amount of milk for each month with its test and the consequent amount of fat. Then, and not till then, will you begin to know definitely, something about each cow and whether it is worth while to feed her any longer.

To such of the cows, as from a record made and kept in this way, appear to be able to pay for it, we would feed, say 2 lbs. oil meal, 4 lbs. bran, and from 4 to 6 lbs. of ear corn as a daily allowance, with all the roughage they will eat. It would be better to grind the corn into corn and cob meal, especially when it begins to get dry and hard. If some of the cows are pretty heavy milkers, try increasing the allowance of bran moderately, or add a few oats. Feeding is very far from being an exact science yet, and there must be a liberal amount of experimenting and close observation to secure best results.

Corn stalks, otherwise called corn stover, vary so much in quality that it is impossible to fix a value upon them. They frequently are equal to good timothy hay, and again are not much better than straw. They can be improved in feeding value by shredding or by cutting. In the latter case we advise cutting a supply for a week or more at one time, dampening the whole mass and let it lie in a pile to heat and soften. There will be much less waste and much greater satisfaction every way.

$5.00 A TRIO

Nicely crated on board of cars here.

Single Fowls, $2.00 Each

They have had the range of alfalfa fields the past summer and are very vigorous.

A. R. HOARD, Fort Atkinson, Wis.

Answers to Dairy Questions by Prof. Farrington.

(Continued from page 849)

than patron A received for the same amount of milk. The reason patron B gets so much more money than patron A is, because his milk tested .7 of one per cent more fat per hundred lbs. milk, and on that account it will make more cheese than the same amount of patron A's milk, which tested 3.8 per cent fat.

This in brief is an outline of a method which has proven a very satisfactory practice for paying patrons for milk at a cheese factory. It gives each man the amount due him according to the cheese value of his milk as measured by the Babcock test.

STARTING A NEW CREAMERY.

Quite a number of farmers near here would like to invest in a co-operative creamery. Agents have been canvassing for stockholders, but failed to secure enough of them to start the enterprise. Several creameries have been built within ten to fifteen miles of here. They have only run a short time and then quit. Many of the farmers are afraid to invest. An agent has been here trying to sell fifty shares at $100 each. Another has been trying to raise $3,850. Both have failed.

Can you give me some specific advice as to how to go ahead and start a creamery that will be reasonable in price and establish it on a basis that will make sure of its continuing the business in the future. The land in this region is very rolling, and most of it ought to be seeded down instead of raising grain to sell. Many of the farmers have been trying private dairying, but do not find it profitable. We think a creamery would pay, but as some of them around here have failed we are a little cautious about starting. We want information that will help to make a success of this, to us, new enterprise.

Retreat, Wis. E. B. H.

The establishment of a creamery in a new territory is a business that requires a certain amount of good judgment at the start. One of the first, and perhaps the most important, things to be done is to canvass the territory within a radius of five to ten miles from a given point and find out how many cows may be depended upon to supply the creamery with milk. It is useless to attempt to start a creamery unless the farmers within a reasonable distance will pledge themselves to furnish the milk from at least three hundred cows. In a good many cases some one is appointed to visit the farmers and get the signatures of different parties expecting to patronize the factory, to a statement that they will agree to furnish the milk of a certain number of cows for a certain length of time.

When you have obtained written evidence that the cows are in sight, the next thing to do is to raise the money for building and equipping the creamery. This is often very satisfactorily done by getting one or two of the reliable farmers in the neighborhood to sign a note for some two to three thousand dollars and deposit this at a local bank, where the funds will undoubtedly be supplied for starting the enterprise.

With this money, the committee or the manager who has the building of the creamery in charge may go ahead and determine what sort of a building is needed; have it erected; buy the machinery and start the creamery in business. The note of $3,000 may then be paid by deducting 5 cents per hundred pounds of milk from each patron's milk check every month. You will be surprised to find how quickly this money will be paid in this way, provided your creamery receives the milk from at least three hundred cows. When this sum is paid then the patrons who have brought the most milk to the factory will own the most stock. This will be perfectly right because more butter has been made for them than for the others, and the amount of money they have invested in the factory will depend entirely on the amount of business done at the creamery for them.

After you have determined to build a creamery you will find it profitable to send one or two men to some factories which are successful and talk with the managers of these creameries. You can get from them an idea of the plan of factory that will be best suited for your locality, and when you have formulated your plans, it will probably be cheaper for you to have the building erected by local carpenters than to let the contract to some firm doing business at a distance from you. When the building is erected you can equip it with the necessary machinery by making a list of the fittings needed and submitting this list to dealers in creamery supplies for their bids. It will always pay to deal with perfectly responsible firms in buying the supplies, and it never pays to buy cheap machines or supplies of any one.

The cost of the new enterprise to the stockholders will depend largely on the amount you will have to pay to erect the building. This is a matter of local concern, and something that you can determine better in your locality than anyone else can calculate for you at a distance. The machinery and equipment for a factory that will make butter from the milk of three hundred cows ought not to cost over $1,500. The building will cost, in addition to this, from one to two thousand dollars, according to the style and durability of the factory you may choose to build.

MOTTLED BUTTER.

"Can you tell me how to remedy a trouble I am having with mottles in my butter? I am skimming a very heavy cream. I am forced to do this because I have not vat room enough to handle all the cream unless I make it as thick as possible. I have to cool the cream by adding ice to it in the vat, and I cannot use a starter because of the size of my vat and on account of the cream being so ripe when it is received, that a starter will do no good. I think that by adding these large pieces of ice to the cream in the vat some of it is chilled, while other parts are not cooled to the same temperature. I stir the cream well in the afternoon, the evening and in the morning, but still I have mottles and at times little white specks in the butter."

Neillsville, Wis. A. H. D.

The ice you add to the cream in the vat may be the cause of the mottled butter you are having, but I do not hardly think it is possible that this is the case. The most common cause of mottles in butter is an uneven distribution of the salt, and the ripening of the cream has very little to do with it.

The white specks you mention noticing in the butter may be due to particles of dried cream, which are not removed when the cream is taken from the vat and put into the churn. These white specks are often noticed when the cream is not strained, and they may be removed by pouring all the cream from the ripening vat through a strainer into the churn. This will take out small lumps of dirt or particles of dried cream, which would otherwise remain in the butter and be noticed as white specks in the finished product.

In order to overcome the difficulty you are having with mottles, I would suggest that you add your salt to the granular butter in the churn, then give the churn a few revolutions in order to mix the salt

"ADVERTISEMENT."

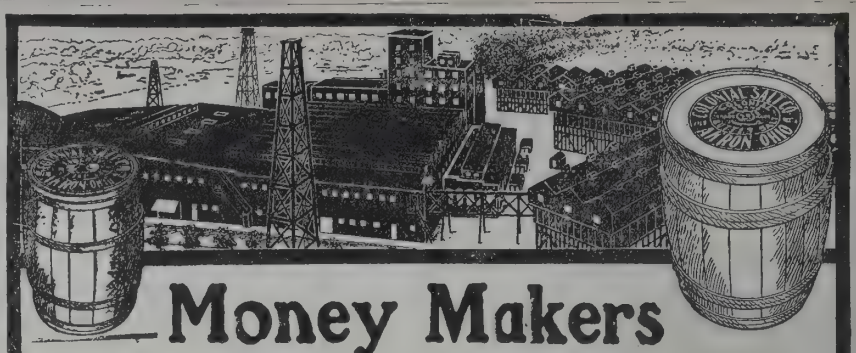
THE VALUE OF CHARCOAL

Few People Know How Useful it is in Preserving Health and Beauty.

Nearly everybody knows that charcoal is the safest and most efficient disinfectant and purifier in nature, but few realize its value when taken into the human system for the same cleansing purpose.

Charcoal is a remedy that the more you take of it the better; it is not a drug at all, but simply absorbs the gases and impurities always present in the stomach and intestines and carries them out of the system.

Charcoal sweetens the breath after smoking, drinking or after eating onions and other odorous vegetables.



Charcoal effectually clears and improves the complexion, it whitens the teeth and further acts as a natural and eminently safe cathartic.

It absorbs the injurious gases which collect in the stomach and bowels; it disinfects the mouth and throat from the poison of catarrh.

All druggists sell charcoal in one form or another, but probably the best charcoal and the most for the money is in Stuart's Absorbent Lozenges; they are composed of the finest powdered Willow charcoal, and other harmless anti-septics in tablet form or rather in the form of large, pleasant tasting lozenges, the charcoal being mixed with honey.

The daily use of these lozenges will soon tell in a much improved condition of the general health, better complexion, sweeter breath and purer blood, and the beauty of it is, that no possible harm can result from their continued use, but on the contrary, great benefit.

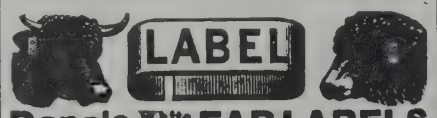
A Buffalo physician in speaking of the benefits of charcoal, says: "I advise Stuart's Absorbent Lozenges to all patients suffering from gas in stomach and bowels, and to clear the complexion and purify the breath, mouth and throat; I also believe the liver is greatly benefitted by the daily use of them; they cost but twenty-five cents a box at drug stores, and although in some sense a patent preparation, yet I believe I get more and better charcoal in Stuart's Absorbent Lozenges than in any of the ordinary charcoal tablets."

Money Makers For Butter Makers

Behind "Colonial" and "Liberty" Butter Salts stands the great Colonial Salt Company plant—absolutely sanitary, modern, and cleanly

Daily output 750,000 pounds.
Storage capacity 25,000 tons.
Six salt wells 3,000 feet below the surface at our plant—the purest bed of rock salt in the country—daily capacity 400 tons of salt.
Cooper shop capacity 2,000 barrels daily.
3,000 horse power boilers.
Daily supply of coal for evaporating salt, 150 tons.
Absolutely pure water from wells 150 feet deep used to dissolve the salt.
Loading tracks under cover hold 22 cars, while switch outside holds 11 additional cars.
Three trunk lines to the plant, Erie, Pennsylvania, and B. & O., facilitate immediate shipment of orders.
Every step in the process is here done by machinery, from the brine to the salt in the package, thus avoiding any chance of impurities of any kind getting into the salt. All packages are made at the works fresh every day; all cars are packed under cover; thus insuring delivery to the consumer in fresh, sweet, clean packages not soiled in any way.
Of "Colonial" and "Liberty" brands of Butter Salt

THE FLAVOR IS PERFECT
THE COLOR PERFECT WHITE



The purity the highest known, over 99 per cent. They are the lightest salts for the same bulk that there is on the market today; dissolve quickly and evenly, do not wash out in the working nor leave the butter gritty or mottled.

"Colonial" Butter Salt (light flaky grain) and "Liberty" Butter Salt (granulated, every grain the same size and perfectly square) may be tried absolutely free of cost by all who have never used them. A 56 pound sack of either or both will be delivered free on request, in return for which you are asked to report to us your actual success with them.

COLONIAL SALT COMPANY, AKRON, OHIO.

GROOM YOUR CATTLE BY POWER

Our Improved Grooming Brushes, revolving 1200 times a minute, insure glossy coat, clean skin, active pores, health and beauty. Their use increases value of all stock. Indispensable for prize winning show cattle. Will groom 30 to 50 head an hour, and do it better than by hand. Get our Free Booklet and learn to groom your cattle, horses and all stock the best way.

with the butter, and allow it to stand at least 15 minutes. The butter may then be about half worked, then let it stand for at least an hour and complete the working. This ought to give the salt time to become thoroughly dissolved and evenly distributed through the butter. If this practice does not remove the mottles I would allow the butter to stand in the churn, after salting, for two hours or more before it is worked the second time. Two workings of the butter, with an interval between workings, is usually a sure remedy for mottles. I hope you will write me again about this matter, as I know you can easily overcome the difficulty you are having at the present time.

Your factory ought to be provided with cream vats large enough to accomodate all the cream you receive and permit you to use a starter in it for ripening the cream. It is poor economy for a creamery to suffer from lack of this kind of equipment. When you write me again I shall be pleased to have you give me more details in regard to the test of your cream and your method of ripening it. Please also give me some information about your present practice in salting and working butter.

WAXING TUBS.

"Will you please inform me as to the cause of mold? I have been troubled with it for the past three weeks and I have examined everything without being able to locate the cause of the tubs molding. I soak them in strong brine for two hours, then put in liners and before I pack the butter. I do not empty the pickle out of the tubs before I want to use them. I steam the tubs all through before soaking and they are kept in a dry warm place, keep all the pipes clean, also all vats and do not put ice in the cream. The temperature varies from 45 to 56. The tubs look clean and it is impossible to notice any mold on the sides of the tubs when taken from the cooler. Will you please give me instructions as to the use of paraffine wax as I will try that next. My trouble puzzles me as I have always handled the tubs in the same manner in the past and this is my first trouble since I am in the creamery business." L. L. H.

Lyons, N. Y.

I am of the opinion that the reason you are having trouble with mold this year, when you have never had it before, is because of the scarcity of wood for making butter tubs. The manufacturers of tubs have been obliged to use unseasoned wood this year and on account of its being damp and not thoroughly dried, mold grows on such wood very easily. I think you can overcome the trouble you are having in this direction by keeping your tubs in a place where they will dry out somewhat before you use them; then if they are soaked and steamed and sprinkled with salt, you will find that the tubs will not mold in the future. It is absolutely necessary that even after the tubs are filled they shall be kept in a well ventilated, dry refrigerator, and shipped to the market in dry refrigerator cars; dampness from any source will start mold to growing in a very short time.

I do not think you will get any benefit from the use of paraffine wax, as it will be expensive to use in all your tubs, and unless it soak into the wood thoroughly, it makes an unattractive appearance on the surface of the wood. You better take better care of the tubs you use and see that they are held in a dry place until the butter is sold. If this is done you will have no difficulty with mold. E. H. FARRINGTON.

Wisconsin Dairy School.

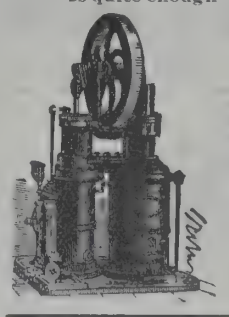
Religion and Dairying.

It was a custom some years since, when a lecturer wanted to get up something attractive for an audience, to make up a list of modern discoveries that had been known by the Chinese, or Hindoos, or Egyptians, and the general argument of the lecture was, that what with the arts and sciences that we had lost beyond recovery and those that were known some centuries ago, the present generation's discoveries were mostly stolen or borrowed. It might be supposed that bacteriology and the use of starters was something new, but now we are told that the use of starters has been practiced in India as part of a religious ceremony, and that means that it is older than Adam.

At the meeting of the "British Association" Dr. W. H. R. Rivers read a paper on "The Toda Dairy," in which he observed that the Todas of the Nilgiri Hills, India, practiced an elaborate religious ritual which was a development of the ordinary operations of the dairy. The dairy was the temple and the dairyman was the priest, There were several kinds of dairy-temple, of different degrees of sanctity, corresponding to the different degrees of sanctity of the buffaloes tended at each. Of these dairies there were three chief grades. The highest kind was found in secluded spots far from any place where ordinary people lived. It was only the milk of the different kinds of sacred buffalo which was churned in the dairy-temple. There were buffaloes which were not sacred, and their milk was churned in the front part of the huts in which the people lived. The more sacred the dairy, the more elaborate was its ritual. In every case the dairy vessels were divided into two groups. The more sacred vessels were those which came into contact with the buffaloes or the milk. The less sacred were those which received the products of the churning. The dairy ritual was accompanied by definite prayer; and the more sacred the dairy, prayer became a more prominent feature of the ritual. In most of the more sacred dairies there was a bell which was an object of reverence, and usually milk was put on this bell during the dairy operations. The more sacred the dairy, the more was the life of the dairyman hedged about with restrictions.

There were definite ordination ceremonies for each grade of office. In the lowest grade they might be completed in less than an hour; in the highest they were prolonged over more than a week. In addition to the three chief grades of dairy, there were certain dairies in which the ritual had developed in some special direction, and there were often considerable differences in the ritual of different dairies of the same kind, especially of the highest grade. Each clan had a special prayer for use in the dairies belonging to that clan, and each of the highest kinds of dairy had also its own special prayer.

Various features of the lives of the buffaloes were made the occasion of ceremonies, often elaborate and prolonged. Whenever the buffaloes went from one dairy to another to obtain fresh pasturage, the journey became an elaborate ceremony, sometimes prolonged over two or three days. Giving salt to the buffaloes was similarly accompanied by complicated ceremonies, and ceremonies were held fifteen days after the birth of a female calf. One of the most interesting of the ceremonies of the dairy was connected with the custom of adding buttermilk from a previous churning to the newly drawn milk. By means of the addition of buttermilk, which was called "pep," a kind of continuity was kept up in the dairy operations, but under certain conditions this continuity was broken, and it became necessary to make new pep, and this might be the occasion of prolonged and elaborate ceremonies.



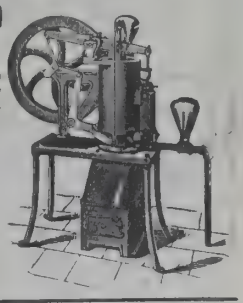
A Class for Farm Butter Makers.

Many farmers' wives and daughters, who regularly make more butter than is required to supply the family, would take advantage of the opportunity to learn more about butter making, but they can not be spared from home to take a ten weeks' course at the Purdue Winter School of Agriculture. It has been suggested that some of them could be spared from home duties to take one week's instruction, were it offered. If several persons want this instruction and will write that they will take such a course, it will be provided.

The plan of the work would be to devote a large part of each day to actual work in ripening cream, preparing starters, churning, working and printing butter, judging and scoring butter as] done at conventions and the larger markets;

HALF ENOUGH WATER

Is quite enough or some people, but most people want water every day. If



RIDER or ERICSSON HOT AIR PUMPS

Are used you can have water every day in the year, and your cook or stable boy is the only engineer needed. 25,000 in daily use. Catalogue "B 5" on application to nearest store.

CORNER BROOME & ELM STS., NEW YORK CITY

Make the Best Horizontal and Vertical Gasoline Engines for all Farm Work. Write for Catalogue No. 360.

BRANCHES. Albany; Buffalo; Hartford; New Orleans; Baltimore; Philadelphia; Pittsburg; Boston; Montreal, Que.; Vancouver, B. C.; Winnepeg, Man.; Toronto, Ont.; London, Eng.

examination and use of the leading makes of hand separators, and use of the Babcock tester for the determination of the value of milk and the loss of butter fat in the skim milk from the separators, and from gravity methods of skimming milk.

In addition to the daily practical work done under the direction of the instructors, there would be lectures on care and ripening of cream, influence of bacteria, methods of making butter and testing milk, with opportunity for questions and discussion as the practical work progresses.

As such a course could only be a week or ten days in length, none but those having had practical experience in farm butter making would be received.

The total expense would be from $7 to $10, exclusive of railroad fare. The date Nov. 30th to Dec. 9th, '03.

If you would take such a course, send your name to Prof. H. E. VanNorman, Purdue University, LaFayette, Ind. at once. Tell your neighbors about it. It will only require ten or twelve to insure the class.

Cream Sampling.

A great many creams will cream on standing just as milks do. And to sample them correctly, thorough mixing by pouring several times whenever practicable, should precede sampling. When thus thoroughly mixed, either dipper or milk thief may be used. Samples, if not taken daily, at least should be frequently taken, and composited, kept from churning in transit by the use of ice and of full packages and from souring by the use of corrosive sublimate or formalin. Check samples should be left at the farm when requested: or a locked and sealed sample jar may be left with each patron, he to control his own sample until it is ready for testing. It then may be divided, one part to go to the creamery for testing, the other to be retained by him for his own testing, or that of the experiment station, *but not for that of a competing creamery*, whose test may or may not be worth anything. A hand tester taken to the farm may be used at times to advantage for the satisfaction of a doubting Thomas.

The preparation of a sample of cream for pipetting may be materially facilitated and, likewise, be made the more perfect by adopting two minor modifications of the process:

1. Heat the sample to 105-110° F. prior to pouring.

2. Use a small, fine mesh, wire sieve and pestle to detect and mix lumpy cream.

1. The heating serves to make the fat more fluid, to soften the harder clots, and in general to render the entire sample more miscible. It should be remembered, however, that the sample expands on warming and that the pipette delivery of a rich cream, i. e. one carrying more than 25 per cent of cream, should be weighed.

2. The mixing of a warm sample, o a cold one for that matter, is vastly bettered if it be poured through a small, fine mesh, wire sieve, such as is commonly in use in the kitchen and is bought for five or ten cents at any hardware or notion store. Lumps, clots and the like are quickly revealed and may, by pestling, by finger rubbing, by further pouring, etc., be broken up and made to pass the mesh. The pestling and breaking up of the lumps is most effectively done with the sieve partly immersed in the fluid portion of the sample. This is particularly true if the sample is at all sour. A few pourings then suffice to mix the sample more perfectly than can be done with many creams by a multitude of pourings. A sieve 2.5 inches in diameter and from 1 to 1.5 inches deep, with a handle, and a tin pint, or quart, measure with straight sides and a diameter slightly larger than that of the sieve, used as a container, works nicely.—*Bulletin 100 Vt. Exp. Sta.*

VETERINARY.

Queries in this department answered by DR. A. H. HARTWIG, Watertown, Wis.

Fever and Foot Rot.

I have lost 15 head of cows in the last 11 months most of them have been with fever. I wish you would give me a remedy for it. Mine is salts and turpentine, 40 to 50 drops in the salts, bathe the back of the head and loins freely with turpentine. I have been bothered with crack heels or warts or some other growth on my cows feet. It looks more like seed warts than anything I know of. Sometime, they get so lame they can hardly walk. P. T. E.
Griffin, Ga.

ANSWER.

1. It is difficult to know what kind of fever you have reference to, please define your case.

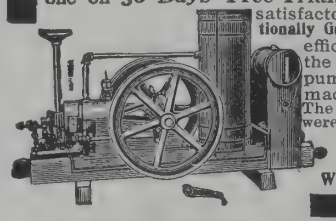
2. The lameness appeaps to be foot rot. Clean out the foot by washing with soap and water, and apply Chloronaptholeum or Zenoleum according to directions on package.

Tuberculosis.

1. What are the first symptoms of tuberculosis in a cow?
2. At what stage in the disease can an infected animal give it to another?
3. Can a bull that is in good condition and apparently healthy, yet by the tuberculin test is pronounced diseased, give the disease to his offspring?
4. Do you regard the tuberculin test as absolutely correct? A. W. E.
Holden, Vt.

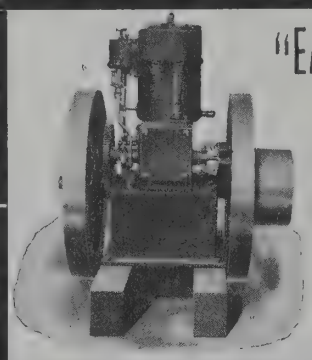
ANSWER.

1. The first noticeable symptoms in tuberculosis are general unthriftiness, a staring coat and sometimes a deep, hollow cough. But these symptoms are only noticeable in the advanced stages.



2. Mostly in the advanced stages when the above symptoms are noticeable.

2. Tuberculosis is a germ disease and is not inherited by the offspring. The only way it can be transmitted, is by actual exposure to the germs after birth.



4. The tuberculin test is only regarded as an aid to the veterinarian in making his diagnosis and cannot be absolutely relied on in the hands of an inexperienced man, as the most chronic cases

30 DAYS FREE TRIAL

In order to prove to you that the **WITTE Gas & Gasoline ENGINE** will do your work perfectly and at less cost of operating than any other, we will sell you one on *30 Days' Free Trial*, and agree to take it off your hands if not perfectly satisfactory. Made in all sizes, 1½ to 40 H. P., everyone **unconditionally Guaranteed.** Simple, safe, durable, cleanly, economical, efficient. Thousands in use, for all power purposes about the farm, ranch, plantation, in factories, etc., running pumps, grinding machines, mills, corn huskers, threshing machines, fanning mills, churns, cream separators, etc. The perfected result of 30 years machine constructing, 17 of which were devoted exclusively to **Gas and Gasoline Engine** making. Tell us what you want to "run" and we will send you Catalog M and price list and tell you the size engine you need. Gas Engines shipped at once either from Chicago or Kansas City.

WITTE IRON WORKS CO., 531 W. 5th St., Kansas City, Mo.

"EAGLE" 4 H. P. STATIONARY ENGINE

1904 MODEL

THIS ENGINE is of the four Cycle type and is especially designed and adapted for use on the farm—for separators, churning, pumping, elevating, hoisting, cutting ensilage, etc. No Expert or Engineer required to operate it—very simple in design and compact in construction. This engine is built so it can be easily moved from place to place. We can supply a special belt driven pumping jack to be used in connection with any pump having a wind mill head. RUB ON

Painkiller

and the Rheumatism's gone.

such as are the most dangerous, will not respond to the test and must be detected by the physical examination. Therefore, the physical examination is the most important when examining for this disease. The tuberculin test will bring out the slight cases which cannot be detected otherwise, and is thus used as an aid only.

Bloody Milk.

I have a heifer that began to give bloody milk in one quarter about 3 months ago. She gave bloody milk for about a week, then went all right for about two weeks, then gave blood for a while then got better. Now she gives nothing but blood in that quarter, and that side is caked quite hard. SUBSCRIBER.

McLean, N. Y.

ANSWER.

Bloody milk usually comes from an injury of some kind to the udder. Sometimes the calf causes it by violently bunting against the udder, or it may be caused by the cow lying on her side and squeezing the parts with her foot. This is especially so in small, narrow stalls. You must first ascertain the cause and remove it; then give the cow one dram of ergot of rye, as a drench, twice daily.

Failure to Come in Heat.

What can be done to make a cow come in heat? C. C. B.

Washburn, Wis.

ANSWER.

Give a dram of nux vomica in food, twice daily, and feed nitrogenous food. Also increase the amount so as to crowd her a little.

Navel Poisoning.

We have a calf born Sept. 7, with a lump on each jaw. The lumps disappeared, and the calf began to froth at the mouth; now it is running at the nose. The odor is very offensive, also the front legs are swollen, from the body to the knees, and the calf cannot stand.

Avon, Colo. MRS. W. L. W.

ANLWER.

The lumps evidently con'ain pus, the result of navel poisoning. The only cure for this trouble is to keep the calf strong by good care and food, so that it will be able to assist nature to resist the disease. You may also give 20 drops of tincture of iron in a few ounces of water twice daily.

Vermimous Bronchitis.

Please give treatment for lung worms in calves. W. H. I.

Delhi, N. Y.

ANSWER.

This disease is combatted by fumigations of tar, phenic acid, cresol, essence of turpentine, tobacco, etc. The practice of fumigating is very simple. The animals have to be kept for a variable time in a place which is filled with the vapor of one of these agents. The vapors by irritating the respiratory passages, produce coughing and expulsion of the worms. We must be careful to destroy the parasites which are thus ejected. It is advisable to give the animals easily digestible food. Intra-tracheal injections of antiseptic medicines are also resorted to with success.

Heart Failure Perhaps.

I had a fine Jersey cow come in on the 12th at noon. I put her in the barn and by the morning of the 13th she had not manured. I gave her a dose of salts and in less than ten minutes she was dead. She seemed to be perfectly well and lively before I gave her the salts. E. P. S.

Sharon, Wis.

ANSWER.

If the cow was perfectly well otherwise it is hardly possible that an ordinary dose of salts could have killed her. Judging from your description she may have had heart failure.

Abortion, etc.

I have had three cases of abortion during the past year and a good deal of trouble in getting cows to breed; some of the worst cases of failure to breed among those that did not abort and that have always bred well heretofore. Two of those that aborted are now several months in calf. Can you suggest any treatment that will prevent them from aborting again? Also what can I do for the poor breeders? I have tried several bulls and now have just brought home a young bull that was in back pasture with heifers all summer. F. T. B.

Saybrook, Conn.

ANSWER.

As your case is not infectious you have nothing to do but to remove the cause. If you do not wish to dehorn the cow which has caused the trouble, keep her out of the herd.

As to the cows that will not breed it is advisable to alter the environments as well as changing bulls. Cows which are sterile usually run to fat. If this is the case it is best to diet them and do not try to breed them until they are in a normal breeding condition. Sometimes there is an abnormal condition of the uterus, which can only be determined by an investigation.

Curb, Splint,

contracted cord, thrush, grease heel and all forms of lameness yield readily to

Tuttle's Elixir.

Used and endorsed by Adams Express Co.

Reading Trotting Park, Mass., Aug. 31, 1899.

VETERINARY PIXINE

"SAVE-THE-HORSE" SPAVIN CURE

$5.00 WITH WRITTEN GUARENTEE

It isn't words, type or page advertisements, it's the truths that ring out sound, clear and impressive—actual results from business men whose standing and reliability can be readily ascertained—which have made **"Save-the-Horse"** such a success. Their cured horses are living advertisements, absolute certainties as to the possibility in your own case, with every bottle is a guarantee document as binding to protect you as the best legal talent could make it.

The fire iron invariably only aggravates the disease or injury, blistering is less effective; both necessitate laying up horse four weeks to several months. Mercurial and poisonous compounds produce irreparable injury. **"Save-the-Horse"** eliminates these factors; Cures without scar, blemish or loss of hair, can apply at any time, anywhere in all conditions and extremes of weather. Horses may be worked as usual with boots, as no harm results from destruction of hair or scalding of limb.

Positively and Permanently Cures Bone and Bog Spavin, Thoroughpin, Ringbone (except low ringbone) **Curb, Splint, Capped Hock, Windpuff, Shoe Boil, weak and Sprained Tendons and all Lameness.**

$5.00 per Bottle with written guarantee, constructed solely to protect you. Head of second bottle almost improbable, except in rarest cases. Send for booklet and copy of guarantee. If case is different than described in booklet or advertising we advise frankly of the possibility of this remedy effecting cure. Give particulars, state age, development, location of swellings, lameness, and describe way horse carries leg.

$5.00 per bottle at all druggists and dealers, or sent express prepaid.

Common Sense and Common Cows.

A Few Facts of Dairy Interest Told by Prof. T. L. Haecker—The Farmer Gets the Profits.

At the McLeod county fair held at Hutchinson, Minn., a dairymen's session was a feature, at which Prof. T. L. Haecker talked of the possibilities of the dairy cow. Among other leading thoughts presented, he said:

"I referred to the fact a few moments ago that the average yield of Minnesota cows was 140 pounds per year. At the Experiment Station the annual average of our herd is 350 pounds per cow. The herd is a mixed one, comprising representatives of the various breeds, and common cows as well. The milk from these cows is weighed at each milking and a test made with the Babcock tester, so that we know just what we are doing. We have the common cow in the herd, because we must know what she can do, as well as the others. We must know this because she is the cow kept by the average farmer throughout the state. The average butter product of the common cow in our herd is 240 pounds per year, or nearly 100 pounds better than out on the farm.

"Kindness is one of the reasons for this, and I wish I could impress upon you the great importance of treating the cow kindly. It is as important as feeding and will give great returns in the pail. The cow must be well kept, kindly treated, and she will give most excellent returns, even though she may be a common cow.

"I used to urge upon the farmer to take the well bred dairy cow but I have gotten over that, because it does no good. At the experiment station we rereceive as high as 450 pounds of butter per year from the best dairy cows. But this fact does not impress itself upon the farmer, even from the financial standpoint. The trouble is, the average farmer will not take to the high bred dairy cow, because he wants one that will also prove a good beef animal. Now, you cannot successfully combine the two in the way he desires. But he cannot see this, and I have given up trying to make him.

"Did you ever stop to think that in the dairy business the farmer gets the profit resulting from his work, while in the beef business he does not. In the beef business you are paid just what five men, who control the great beef combine, agree to give you, and they take the profit. In the dairy business you control yourselves, even practically to the commision the commision man gets. Now, why try to make a success of both, when one or the other is practical? If you wish to follow dairying why not take the best cow and reap the largest profits? This large return I have spoken of from the dairy cow is from the butter product alone. I have not counted in the calf, because that is not fair, for one calf may be worth more than another. Now you say, the steer calf from this high bred dairy cow is worthless, and we lose it altogether. No you don't. You can get about as much, if not fully as much, for it for veal as you can for a calf from the beef breeds, and the increased return from the high bred cow will more than make up the difference you would make from the beef steer.

"But right here comes the complaint, 'you are receiving aid from the government to carry on the experiment station. If out on the farm we could have such a fund to fall back upon, so that we could buy some of these expensive foods, we could make some of these high records.' Now it is true that we receive government aid and aid from the state also. The government has recognized the value of the work we are doing, and is encouraging it. But in the handling of this dairy herd, we aim to make it as practical as possible, so it will be of some benefit to the farmers of the state.

"For the purpose of ascertaining the true value of these foods, the herd was divided and one portion was fed on these more expensive foods, while the other portion was fed from what every farmer has in his bin—a combination of corn, barley and oats in equal parts. Now what was the result? A careful account was kept of these two sections, and just as good returns were received from the portion of the herd fed on corn, barley and oats, as from the one fed on the high priced foods. The farmer has everything in his barn from which to get as good results from the dairy cow as we have at the station.

"Now the real trouble is, the average farmer does not like to milk, and he does not any longer than he can help. In ten or fifteen years he often makes enough out of the common cow so that he can retire from the business and simply raise beef, and I am glad he has a business that gives him such good results—even from the common cow.

In closing, Prof. Haecker called attention to the careful handling of cows at the time of calving and the general treatment of them. He pointed out from a couple of cows at hand the chief points of the dairy cows.

"A good dairy cow, well and comfortably kept, ought to pay her owner $100 per year. And when it comes down to the steer from the dairy cow, there is not really as much difference as we are often told. I have at the Experiment Station six steers from registered dairy cows, not yet two years old, fed as any farmer should feed them, that will weigh from 900 to 1,200 each. They are just as good as any of your beef breed, and the profit from them and the cow would be much greater. The condemnation of the steer of the high-bred dairy cow is simply a matter of prejudice."

Raising Heifer Calves for the Dairy.

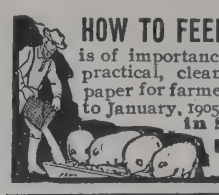
turn the mothers in to them three times a day for four or five days, in order that they may have three meals a day by natural method, until they get a fair start. I usually sprinkle a little salt upon the calf as soon as it is dropped, in order that the mother may lap it dry and be the readier for her warm drink a little later. If the weather is cold, I take the calf to warmer quarters immediately, and rub her dry with a cloth, beginning at once to feed by hand. A quart of the mother's milk three times a day is enough for the first week. All milk fed for the first three months is warmed to blood heat, or given fresh from the cow.



It is a little harder to teach the calf to drink from a pail if not taken from the mother at once, but I firmly believe she grows better if allowed to feed in the natural way for a few days. In the case of Jerseys or Guernseys there may be once in a while a cow whose milk is too rich for her calf, under which circumstances it is probably better to change to diluted milk as soon as the bowels of the calf show that there is trouble.

At the end of the first week my calves are taking, from galvanized pails, three feeds a day, one to one and one-half quarts at a feed. Don't overfeed; it is not a big quantity of milk that makes a calf grow, but a small quantity at the proper temperature, fed regularly, in a clean pail. I like to continue with whole milk for two weeks, then begin to taper off to skim. At the end of four weeks I am feeding twice a day four quarts skim milk at a feed, with two small handfuls of old process linseed meal thrown in dry and mixed with the milk at each feeding. I begin to use the meal and the skim milk together, a little of each at first, and gradually increase the quantity of both until I have arrived at the above amounts some time between the third and fourth week, depending upon the vigor of the calf. I never give more than eight quarts milk a day at any age.

A box of bran is placed where the calf can get at it from the start. As soon as she begins to eat the bran I feed the milk but twice a day. Clover or fine timothy hay is always within reach. At noon I give a drink of lukewarm water. After she is a couple of months old, if the weather is good, I turn her out into the yard for a few minutes and let her run, and drink at the trough. Whole oats are a fine addition to the ration, as soon as she will eat them. I put a handful into the bran, and she soon discovers they are good. Give a little salt occasionally, not in the feed, but where she can lap it. As she grows older, one learns her capacity for bran, oats and green stuff, and can put her upon a regular ration. I feed her the same roughage, including silage, that I give to the cows. A very important matter is to keep dry, clean bedding under the calf. Shavings are the best that I have used. The calf will be stunted with certainty if kept in damp, unclean quarters.

I would rather not turn spring calves to pasture the first season. They make a better growth for me when kept in the barn during the first summer, and fed regularly. They get the clean stuff that is brought in for the cows, the latter being soiled, with the help of silage, the year round. A run in the yard every day is good for them, but my experience is that pasture does not make them grow like milk, grain and soiling crops fed in the barn. When they are in pasture the fly gets in his deadly work in July, August and September. If they are in the barn, we can spoil the fly's fun with the sprayer. All my stock are sprayed in fly time.

Very likely the secret of the better growth in the barn is, that the calf is right under the eye all the time, and one notices whether things are going right or not. All young stock should be where it can be watched. The start is all important. I feed skim-milk for six months, and longer if I have it. Fall calves are tethered upon a grass plot as close to the barn as possible the first summer. They have bran and oats in addition to the grass.—THOMAS WALLIS in *New England Farmer.*

Buy You a Ticket to CROOKSTON, MINN., and call upon

The Polk County Land & Loan Company

For Choice Red River Valley Farms. They pay railroad expenses if you buy from them. A few good bargains.

360 acre farm, 4½ miles from Crookston, Minn., a city of 7,000 inhabitants, and 2½ miles from the State Experimental Farm. This is a photograph of the buildings as they are today: House is 16x24 1½ stories with an L 14x22, and a wood shed in connection 20 feet square, all on a brick foundation. Barn 28x48, with a lean to 16x48, sheeted both inside and out. Two granaries, one 14x80, and the other 14x42. The buildings are all well painted and in very good repair, and has a fine artesian well. Every acre of this farm is under a high state of cultivation, and is well drained by a slight ravine running through the farm merely sufficient for self drainage. The soil is a rich, deep black loam with a clay sub-soil, and in every respect is considered to be one of the best farms in that vicinity. Our price on this farm is $35.00 per acre.

This is a **320** acre farm about 2½ miles south of the city, this farm is quite well improved, has a very good house of about seven rooms, 1½ stories, barn large enough for ten head of horses, also a good granary, pasture and an artesian well, also has a good well at the house, good grove around the building. This is a very choice piece of land for the price $32.50.

160 acres north-east of the city; this is all hay land, and located in a German settlement, the surrounding country is nearly all under cultivation; we consider this a good piece of land for an investment, this could all be put under the plow, if desired. Price $19.00 per acre.

FARMING!

Is a sure thing in the district in Minnesota between St. Paul and Minneapolis and Duluth and Superior because there is a market at good prices for everything the farmer produces. This is the greatest natural grass district in the west and splendidly adapted to dairying, stock raising, as well as the growing of small fruits and vegetables. Four great cities within 75 miles. Same grade of clay land in Southern and South Central Wisconsin from $50 to $80 per acre. Our prices from $7 to $15 on 10 years time. This is the time for laboring men or men on salaries who want to be independent to get 40, 80, or 160 acres well located and make a start. Write for illustrated book and map to largest owners of Central-Eastern Minnesota lands.

21 STRONG REASONS

WHY IT WILL PAY YOU TO BUY A FARM IN THE GREAT BLUE GRASS COUNTRY OF NORTHERN WISCONSIN.

1. The soil is rich and productive. Everywhere there is a clay subsoil to retain the moisture.
2. The climate is very uniform—neither extreme of heat or cold.
3. The seasons are regular and there is never a crop failure.
4. There is an abundance of wood for building and fuel, which need only to be cut.
5. Taxes are very low compared with other sections.
6. It is the best agricultural country known for a man of small means to get rich.
7. It is better to own a low-priced farm than to owe for a high-priced farm.
8. You can own a home in this section for what you now pay out for rent in one year.
9. Everything grown in the west can be grown on these lands.
10. There is an unsurpassed market for all farm products throughout the year.
11. Truck farming is very profitable in this section.
12. No better fruit country in the northwest. All northern varieties are wonderfully successful.
13. The best place in America to raise horses, mules, cattle, sheep and hogs.
14. The water supply is the best. The country is full of clear running streams and springs
15. Cereal crops average more bushels per acre than in other northern states. This may be said particularly as to oats, the average yield being from 60 to 80 bushels per acre.
16. Grasses and clovers for grazing or hay grow luxuriantly, far better than they do in southern Wisconsin, Iowa, Minnesota, or the Dakotas.
17. No swamps in this section—no malaria, no chills, no fever, no cyclones, no hail or destructive storms.
18. Fish and game in abundance. It is the sportman's paradise.
19. Lumbering and manufacturing interests offer ample employment at good wages whenever desired, both winter and summer.
20. Thousands of settlers are moving into northern Wisconsin, and in consequence land is increasing in value very fast.
21. The best class of people are among the settlers, which include principally Americans, Germans and Scandinavians.

DON'T PAY RENT, but come up and let us sell you a farm which will cost you but little more than the rent of a good farm in the older agricultural districts. Not only that, but a farm that will grow in value every day. Write us to-day for full particulars concerning these lands, and arrange to look them over at the earliest possible moment. They cannot fail to interest you if you want to get a home of your own. Mention HOARD'S DAIRYMAN.

A RARE CHANCE

FOR A GOOD DAIRY FARMER

A farm of 465 acres will be sold cheap and on easy terms to right party. Farm is located at Waucota, Goodhue county, Minn., on river division of the Milwaukee road. East line of farm Lake Pepin. West line the railroad. Station within a hundred yards of buildings. Waucota is less than 50 miles from St. Paul and Minneapolis. Farm has 300 acres under plow, 100 acres pasture, balance timber. Barns for 40 cows, horse barn, granary, buildings for small stock, etc. House, 8 rooms. A rare chance for either a butter maker or one desiring to ship milk to the Twin Cities. For further particulars address

J. NEWTON NIND, Kimball Building, Chicago, Ill.

Wisconsin

offers unexcelled opportunities for those who want to stop paying rent and make money in agriculture, in the fruit or dairy industry, or in sheep raising. Along the lines of the

Chicago, Milwaukee & St. Paul Railway

in Northern Wisconsin are many tracts of land admirably adapted to the homeseeker. In former timber tracts are many cultivated farms worth $50 to $75 an acre. Adjoining them, enjoying the same advantages, are unimproved farms for $7 to $20 per acre. Why not take a trip there and investigate these openings for yourself?

Additional information on request.

F. A. MILLER, GENERAL PASSENGER AGENT, CHICAGO.

"ADVERTISEMENT."

IS YOUR STOMACH ON A STRIKE?

There is Nothing to Prevent You Employing a Substitute to Do its Work.

There is such a thing as forbearance ceasing to be a virtue even in the case of one's stomach. There is no question but that some stomachs will stand a great deal more wear and tear and abuse than others, but they all have their limit and when that limit is reached, the stomach must be reckoned with as sure as fate. The best way and really the only effective way to treat your stomach when it rebels is to employ a substitute to do its work. This will give the weakened and worn-out organ an opportunity to rest and regain its strength and health.

Stuart's Dyspepsia Tablets relieve the stomach of its work by taking up the work and doing it just as one set or shift of workmen relieves another. They actually digest the food in just the same manner and just the same time as the digestive fluids of a sound stomach do. In fact, when dissolved in the stomach, they are digestive fluids for they contain exactly the same constituents and elements as the gastric juice and other digestive fluids of the stomach. No matter what the condition of the stomach is, their work is just the same. They work in their own natural way without regard to surrounding conditions.

The stomach being thus relieved by Stuart's Dyspepsia Tablets, is restored and renewed by Nature and the rest of the human body does not suffer in the least by reason of its failure to perform its work.

A Wisconsin man says: "I suffered the pangs of dyspepsia for 10 years. I tried every known remedy with indifferent results until I was told of the remarkable cures of Stuart's Dyspepsia Tablets. I bought a box, began taking them and forgot I had a stomach. Three boxes cured me completely. I have had no trouble whatever for a year and have an appetite like a harvest hand and can eat anything that is set before me without fear of bad results."

Stuart's Dyspepsia Tablets are for sale by all druggists at 50c a box. The druggist never fails to have them in stock because the demand for them is so great and so pronounced that he cannot afford to be without them. People who could not get them from one druggist would go to another and would get in the habit of buying their other drugs there as well as their Stuart's Dyspepsia Tablets.

NATIONAL FURNISHING CO., Box 1110, Detroit, Mich.

The Farrowing of the Sow.

(Continued from page 842.)

eleven pigs in all, eight of them saved. As to the runt, I think it could not be saved anyway, and it would not be worth saving anyway. But as to the two other dead pigs, we feel sure they were injured by the moving of the sow, and that had the sow been left in her own nest in the thicket, these two would not have come dead, though the chances were that they would be killed or smashed by the sow later.

The mistake in this case was in permitting the sow to go out of her pen this day. A sow will take to the woods any time in preference to the very best farrowing pen provided for her by man. As to moving her from her improvised nest in the thicket, past experience in similar cases prompted us to do so; others might have acted differently and with more wisdom, and this is why we tell the story, which will be familiar wording to all who keep pigs and, we think, of some interest.

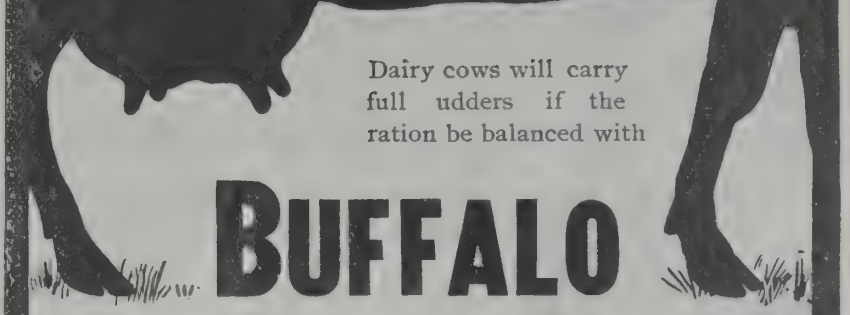
P. E. I. J. A. M.

Better Milk for Cities.

ED. HOARD'S DAIRYMAN:—Cities are rapidly waking up to the importance of a better milk supply; the farmers are realizing more and more that the movement is one of importance to them. The better the milk the more will be consumed and the better will be the price paid for it. The movement is noticeable in each of the cities that I have visited this fall, but its appearance is manifested in a different way in each one.

In Albany, N. Y., for example, there is no very pronounced demonstration, but the movement is on for all that. Farmers still retail about one-half of the milk consumed, while dealers located in small shops in various parts of the city do the remainder of the business, aided by their several wagons. I visited two of these places. In one, Mr. L. B. Tibbitts, the proprietor, has been engaged for twenty-three years, being the oldest dealer in the city. He handles 20 to 25 cans per day, buying direct from farmers in Washington and Saratoga counties. Albany county is not a dairy county, though, of course, some milk is produced there. He says he gets good milk and that the farmers are improving; claims that the milk he gets averages 4 per cent of butter fat. The price paid the farmers averages 2½ cents per quart net for the year.

Mr. W. H. S. Miner, whom I also called upon, is the largest dealer in the city. He has twelve routes, besides selling from his store. His purchases are also made direct from the farmers, but he buys in Schoharie and Herkimer mostly, with some purchases in Washington county. His price nets the farmers practically the same as Mr. Tibbitts'. He handles from 100 to 125 cans of forty quarts per day.



The milk is well cooled and aerated and appears to have received good treatment at the farm. It was claimed that some of the dealers pasteurize, but this is doubted by some of the city officials. No pretense is made of furnishing certified or clarified milk. At the office of the Board of Health it was stated that the milk supply is good, giving as evidence the low death rates of infants in that city, especially from diseases likely to be caused by bad milk.

No systematic inspection has been undertaken by the department, owing to lack of funds, but the general inspector of foods makes occasional examinations. The state Department of Agriculture has been more thorough, though its field is somewhat different from that of the health department. Here I was informed that great changes have come about in Albany's milk supply, during the last twelve or fifteen years. There was a time when the milk sold in this city was more than half water, while now there is practically no adulteration of that kind.

The present condition appears to be pretty good, taking all points into consideration, but it wouldn't be surprising if a more definite knowledge of the milk supply might be demanded at some time in the not far distant future. At present the inspection by state officials and the demands of consumers, together with pecuniary interests of farmers and dealers in a good milk supply, is what keeps up the standard of quality. The directness from farmer to consumer, and the watchfulness of the state department appear to insure a pretty good grade of milk.

Chenango Co., N. Y. H. H. L.

NORTHERN LINSEED OIL CO.,

MINNEAPOLIS, MINN.

When ordering mention this paper.

SWEEP GRINDERS $13.75

Grind 46 Bus. Baskets Ear Corn Per Hour

with this Improved Wolverine Ball Bearing, Triple Geared Grinding Mill. **CRUSHES AND GRINDS** ear corn in any condition: shelled corn, rye, oats, barley, Kaffir corn, etc., singly or mixed. Makes coarse, medium or fine feed as desired. Never "chunks" or "hogs" the feed, but produces an even and uniform product. **It is the only sweep mill guaranteed to equal the work of a buhr stone mill.**

IT IS STRONG and is made of the best material money can buy. The castings in the gears are specially heavy and will stand the most severe strain that can be legitimately required of a grinding mill. **The quality is shown by the weight which is 600 pounds.** If it were lighter it would be cheaper, but not so good. **CAPACITY.** This is a stumbling block in the way of grinding mills. We have tested this one under all conditions with all kinds and quality of grains. **Our statement is a guarantee: If the corn is dry, and the team makes five rounds per minute this mill will crush and grind 46 bus. baskets of ear corn per hour.** If the team makes three rounds per minute it will grind 28 bus. baskets per hour. Grinding finer, the capacity is less. **LIGHT DRAFT.** Notwithstanding the enormous capacity of this mill it is the lightest draft sweep mill known. **This is so because it is fitted with specially made hardened steel Ball Bearings.** These ball bearings will last a lifetime with ordinary care. We replace any that are found defective or wear out within five years.

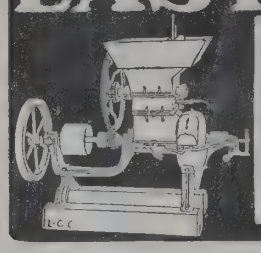
$23.25 OUR OFFER. We know that this mill is so good, and so entirely reliable that we will ship it to anyone in the United States with the understanding that if the mill does not do just as we claim, and does not grind more than any two-horse mill made by any other manufacturer of any construction, of any size buhrs; if the mill is not made on more scientific principles; if it does not grind a more uniform quality of feed and if it is not better in every way than any other sweep mill, it may be returned to us at our expense within three days of the time you receive it. Test it in comparison with any other mill and keep the one which is best. **LARGE LINE.** We have eight sizes of sweep mills, $13.75 and up, and thirty other styles and sizes of grinders suited to all grains and purposes.

CUT THIS AD OUT and send it to us and we will mail you our special farm machinery catalogue. Don't buy a grinding mill of any kind until you get it. It is sure to save you money.

MARVIN SMITH CO. 55. 57. 59. N. JEFFERSON STREET. CHICAGO. ILL.

WINCHESTER

WINCHESTER No. 12 NEW RIVAL



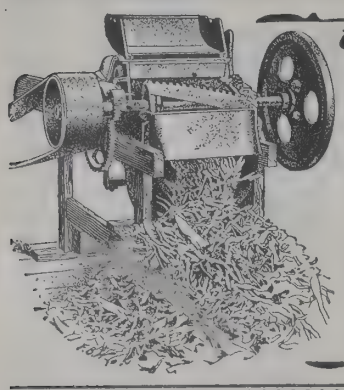
"NEW RIVAL"

Loaded Black Powder Shells shoot stronger and reload better than any other black powder shells on the market, because they are loaded more carefully and made more scientifically. Try them. They are

THE HUNTER'S FAVORITE

LOADED 3¼ 1⅛8 W.R.

EASY GRINDING



Corn in the ear and all grains, any sort of chop mixture. For speedy and perfect work, saving feed and labor, the all-purpose grinding mill is the

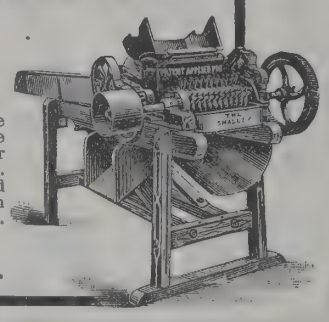
Made in a variety of styles, including **Power Mills, Sweep Mills, Mill and Power Combined.** The line that meets feeders' wants and is right in price. Don't buy until you have seen our late catalogue. Mailed free. Write for it to-day.

THE FOOS MFG. CO., Springfield, Ohio.

The 1903 Shredder Blades

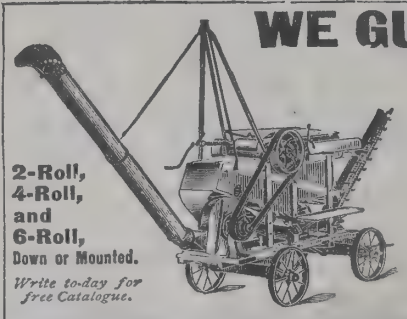
(Patent Applied for)



make efficient shredders out of "Ohio" Feed and Ensilage Cutters. The **New Shredder Blade** is the regular "Ohio" knife with solid integrally projecting bits which cut and tear corn stalks into a nicely shredded condition, as shown in the picture. It makes corn-hay of the fodder.

Shredder Blades are interchangeable with knives on all sizes "Ohio" Cutters. They successfully reduce fodder to the proper condition and do not pulverize the leaves like other styles. **They shred** with the same power, speed and capacity as "Ohio" Cutters, and either the Chain or Blower Elevators handle the shredded corn perfectly. **Speed,** 600 to 700 revolutions. **Power,** 2 Horse Tread up to 12 h. p. Engine according to size. Let us send the 1903 catalogue of "Ohio" Cutters and Shredders. "Modern Silage Methods" 10c, coin or stamps. Manufactured by

THE SILVER MFG. CO., Salem, Ohio. *Established 1854.*



THE SMALLEY SHREDDER

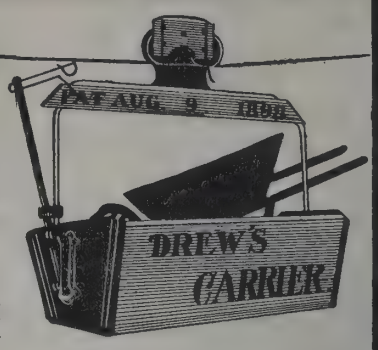
HAS NO EQUAL.

It gives fodder the greatest food value, and makes it easier for the animal to masticate and digest. Requires least power; strong and durable; will outlast a dozen of the saw pattern kind. Knives adjustable to compensate for wear. We can furnish snapper rolls to remove all the ears, just the same as a husker. This combination of cutter, shredder and snapper, costs but little more than the ordinary cutter. We also make drag and circular saws, sweep and tread powers, and ensilage cutters with carriers or blowers to reach any silo. Our free catalogue tells all about our goods. Address Box No. H

SMALLEY MFG. CO., Manitowoc, Wis.

WE GUARANTEE that under the same conditions as to power and speed applied, condition of corn, etc.,

The Appleton Corn Husker



will do more and better work than any other machine of like character and corresponding size on the market; that it is simpler in construction; easier in every way to operate; easier and safer to feed and to require less power for successful operation. Proof of these claims is sent for the asking. We make also a complete line of sweep and tread horse powers, shellers, ensilage and fodder cutters, feed grinders, wood saws, windmills, etc. **Remember that Appleton quality** is the standard of excellence.

2-Roll, 4-Roll, and 6-Roll, Down or Mounted.

Write to-day for free Catalogue.

APPLETON MFG. CO., 35 Fargo St., Batavia, Ills.

GOODBYE, WHEELBARROW

Every farmer who gets a Drew Elevated Carrier has no more use for the barnyard wheelbarrow. The

DREW ELEVATED CARRIER

will carry the manure from the stables to any point in the barnyard, drop it, return automatically, ready for another load.

It is self operating—it turns curves and switches—dumps its load in yard or wagon. Besides carrying manure you can use it to convey ensilage, feed, grain, potatoes, cans of milk, from one point to another. It works so simple and easy that any man or boy can run it.

THE DREW ELEVATED CARRIER

carries labor off from the farm—it is the farmer's labor and money saver. No trouble to put them up—no trouble after they are up.

It leaves barnyard free from posts—keeps the barnyard clean and free from litter. Get one and

"WATCH IT WORK FOR YOU"

WRITE FOR OUR ILLUSTRATED CATALOGUE, FULLY EXPLAINING ALL ABOUT IT.

Also receive testimonials from hundreds of farmers and dairymen who have the Drew Carrier on their farms.

Why He Sells The Tubular

An implement dealer said, "We have to judge for our customers—protect their interests—handle goods we know are safest, surest, handiest—look at separators just as our customers would—question manufacturers about their separators just as carefully as our customers would. That's why I handle the Tubular—that's why I advise others to handle it. It's built on common sense—the kind of sense my customers have.

Now With The Tubular

If your customer asks, "Is the Tubular easy to feed?" point to the supply tank—hardly waist high. "Is it easy to wash?" Show him the simple three piece bowl. "Is it easy to turn?" Lift the gear case cap—explain how every working part is perfectly covered. "Is it durable?" Call his attention to the single ball bearing from which the bowl is hung—explain that the Tubular never wabbles—cannot bind—cannot become unbalanced—that Tubular gears need no oil cups but run in a mist of oil. "Is it sure?" Show the bottom feed—the device that helps make the Tubular the closest skimmer known.

You can tell him the Tubular is the only separator possessing any of these special, strong features.

You can sell him a Tubular when he would not buy the best of any other make. Why? Because all others are alike—antiquated bucket bowl machines—because the Tubular is different—a "right-now" separator.

Write for our complete catalog No. 144, it describes hand and power Tubular separators.

Alfalfa on Overflow Lands.

In a recent *Breeder's Gazette*, Mr. Spillmans says: We are continually learning new things about alfalfa, so that it becomes necessary occasionally to revise our ideas. During the past few months a number of well authenticated instances have been brought to light where alfalfa is thriving perfectly this summer, although it was flooded many feet deep last winter.

R. E. Smith, Grayson Co., Texas, tells me that part of his alfalfa field was covered seven feet deep by water, and that a large amount of sediment settled on the land. As soon as the water went down and the ground became dry enough to work, he went over the field with a disk harrow and the alfalfa showed no ill effects from the flooding.

C. M. A. Smith, Onondaga county, New York, who lives in a section where alfalfa has been grown for many years, sends me a detailed account of a field of alfalfa in his vicinity which was overflowed in 1902 to the depth of a foot or more; and in 1903 it was overflowed again and ice formed to the thickness of an inch or more. The water raised this ice an average of two or more inches and then froze solid. Quoting from Mr. Smith's letter:

"When spring broke the flats were covered with water for a considerable period before this water subsided. While the plants looked weak they still lived and the owner has just harvested the second cutting. The soil of this field is what we would call a limestone soil with gravel beds on it."

Continuing Mr. Smith says: "In visiting the place to-day I found a heavy, hardy field of alfalfa, yielding, I should judge, nearly two tons to the acre of cured alfalfa hay of very fine quality."

These facts seem to indicate that there is a difference between the overflowing of an alfalfa field by a stream and flooding it from an irrigation ditch. This may be due to the difference in the season of the year when the overflow occurs, the flooding from irrigation occurring during the growing period, while the overflow from a stream usually takes place during the dormant season.

The temperature of the water may also have something to do with it. In the summer season in the west it is practically always clear weather, and in the daytime may become quite warm. Irrigation water left standing upon the fields has its temperature considerably elevated in a few days, while the water from a flowing stream remains cold. Another possible factor may be found in the atmospheric oxygen dissolved in the water. The flowing water would be well supplied with this, which would enable the alfalfa plant to breathe normally. The standing water from irrigation would soon become exhausted of its dissolved oxygen and would tend to smother the plants.

Since alfalfa yields such large crops on good rich land I hope any of your readers who have had experience with alfalfa on land subject to overflow will give the rest of us the benefit of it.

The Great Change.

Hon. H. E. Hoard, brother of the Senior editor, and proprietor of the *Leader* at Montevideo, Minn., in writing a private letter indulges in a reminiscent glance at what has been wrought in the way of dairy improvement in the west in the past 30 years. The following paragraph from his letter is suggestive, to say the least:

"When I think of the great changes in the northwest since you and I sent to our father from Columbus, Wis. in 1867, for a tub of York-State butter, because there wasn't any to speak of, out west, and the general opinion was there never would be, I feel like commending you somewhat for the great change that has come. Not that you made the change, but that you have spent more than half your life in everlastingly pounding it into the heads of the people, until they made the change.

What would this year have been to our people if they had raised all wheat, as they did 20 years ago? It would have been about as bad as the grasshopper plague, but with cows and hogs, sheep and poultry, corn and tame grasses, creameries and practical common sense put in practice, they will do fairly well in spite of rotting grain and bad roads. The change to diversified farming has been the salvation of this region, as well as of yours, and all are benefitted—even the one-idea, wheat farmers."

BUFFALO GLUTEN FEED

Digestible.

Protein in concentrated feeds must be digestible to be of value to the dairy farmer. Indigestible protein makes fertilizer—not milk.

Buffalo Gluten Feed Protein

is almost wholly digestible; that's why it is the

Greatest Milk-Maker Known.

Ask your feed dealer.

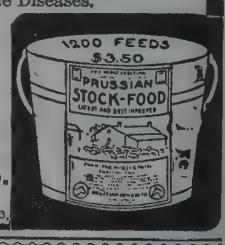
HURRY-UP PORK



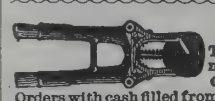
The kind that is born in March or April and goes to market before Christmas, is the kind that makes money for the farmer. These conditions are a sure result of the feeding of

Prussian Stock Food.

It only requires a small amount of the Food mixed with the regular ration. The returns will be surprising. Hogs will take on growth, fat and consequently weight away beyond your expectations. It conditions the stomach and bowels, Removes Worms and hogs fed on it digest and assimilate the greatest amount of feed and turn it to good account. Because of these things, hogs fed on Prussian Stock Food are less liable to Cholera and other Swine Diseases.

Saved 130 Hogs from Cholera.

Last fall the cholera got into my herd of 200 head of hogs and I lost 70 head, but after the free use of your food I saved the remaining 130 head. My hogs are now in a good, healthy condition and as I am still using Prussian Stock Food I believe they will keep so.—R. Chisholm, Lanark, Ill.



Use Knapo-Curo Disinfectant for all Contagious Diseases.

Prussian Stock Food is guaranteed to give satisfaction when used according to directions. If no dealer at your place write us. Tell us how many head of stock you have and where you saw this ad and we will send you our 68 page Farmer's and Stockman's Hand Book Free. PRUSSIAN REMEDY CO.

A Month's Record of a Wisconsin Herd.

ED. HOARD'S DAIRYMAN;—I sent to you last May for some of your milk record blanks, and now enclose you the results of my work through the month of June, and would like your comments. The herd consists of fifteen high grade Holsteins, having been graded up by the use of two high grade, and then four pure bred sires. They were milked twice a day and had timothy, clover and blue grass pasture, but no grain. The cows were on rye pasture about three weeks the fore part of May, and heifer No. 2, that was two years old April 1st and due to have her first calf August 20th, had to be milked and gave between nineteen and twenty pounds of milk a day through June and I am having some difficulty now in getting her dry. Have any of your readers ever had such a one? It is our first of this kind.

Our milk is weighed every day and a composite sample taken each Wednesday and tested at the end of each month. Cow No. 13 has always been a favorite of mine and I consider has done remarkably well as she is due to calve again in September. She is the mother of Nos. 6 and 14, and they promise to be as good, showing that good blood will reproduce itself. No. 7 is also the mother of No. 4.

I enclose you under another cover a snapshot of some of my heifers. The one at the left is two years and four months old, about due to calve and weighs 1,260 lbs.

JUNE 1903. NAME OF COW.	Age at last calving.	Days from calving that test commenced.	Pounds milk for month.	Comp. samp. tested.	Pounds fat for month.

*This heifer was on rye pasture and her udder became so distended that she had to be milked. Test started 20 days after and 80 days before first calf was due.

Hillsboro, Wis. J. M. WAGNER.

This is a highly instructive record, and one which every dairyman, not doing as well, should earnestly strive to emulate. It is by no means so extraordinary as to excite suspicion, but it does imply the exercise of good judgment and that foresight which does not expect satisfactory results with adopting the means conducive to such results.

The case of the heifer giving milk before birth of first calf is unusual, but not without precedent. Such happenings indicate pronounced dairy heredity and temperament.

Answers to Dairy Questions by Prof. Farrington.

INFLUENCE OF SALT ON BUTTER QUALITY.

In our vicinity there is a co-operative creamery which has had the same man for a butter maker for about six years. He has never had even a common school education and what he knows about butter making has been obtained by apprenticeship. He is getting $100.00 a month, plus house rent and such dairy products as he may use in his family. He has to take care of ten to fifteen thousand pounds of milk a day and hire his own helper. He has until lately always made good butter, which sold for the top market price. Lately he has been in the habit of rushing his work in order to get through and then attend to business affairs of his own and working for the neighbors. He took a vacation this summer and left as a substitute a man, who has not had any experience in butter making, to run the creamery. Not long ago our butter which came from this factory was not of its usual good quality, but seemed to be lacking in grain and body; the color was uneven and whitish. We thought it was perhaps overworked and that the next butter we got would be all right. This did not prove to be the case, as the butter has not been good for some time. We inquired among the patrons and found that all the patrons were being treated in the same way, that is, they were given butter of very poor quality. Further inquiry showed that two shipments of butter from the creamery had been cut in price and that a third was returned to the creamery because of its poor quality. The butter maker, who has to make good all losses on poor butter, had this butter put in cold storage. He sold some of it to local dealers and was trying to work the rest of it off on the patrons. This, of course, was done for the purpose of diminishing the loss on poor butter which was returned to him. When asked to explain why the butter was so bad, he said that it was on account of poor salt he had been using. The salt was the same which has been used at the factory for years and when the agent of the salt came to see what was the matter with it he was unable to find the salt defective in any way. One thing very noticeable was that the whole of one shipment was not of poor quality, but only part of it, although it was all salted with the same salt. Now what I want to know is this:

First. Is there a chance of his excuse of poor salt being the cause of the defective butter?

Second. Should not a butter maker getting the pay which he gets be able to discern between good and poor salt for butter?

Third. Can a graduate of the state dairy school do this?

Fourth. Does the state hire a man to inspect creameries?

Fifth. Does a person need to have any experience in a factory in order to enter the dairy school?

Sixth. When does the dairy school open this fall? H. A. M.

Fort Atkinson, Wis.

Replying to your questions in the order in which you ask them, I beg to say:

First. Defects in the body and texture of butter can uot be charged to salt whether it is good or poor. The texture is sometimes injured by overworking in order to thoroughly dissolve the salt if the salt has unusually large crystals, but it is not often that this is the case and I cannot understand from your description how salt may be the cause of the defects mentioned.

Second. A man who has made butter for a number of years ought certainly to be a good judge of the quality of any butter which may be brought him. It is sometimes a fact, however, that where butter makers are familiar only with their own butter they are not likely to noticecertain defects which their familiarity with the butter has led them to think are the qualities of good butter. Impartial judgment in regard to butter may be obtained from so many sources that I think it is hardly a fair question to ask as to whether or not a certain man ought to be a good judge of butter from the experience he has had.

Third. A graduate of the Wisconsin Dairy School when he leaves the school, is usually well informed in regard to the scoring of butter, but if he does not follow up the business and keep himself in training, I think he is as likely as anyone else to forget some things he has learned and on this account he may not always be a first-class judge of butter wherever you meet him.

Fourth. There is a state creamery instructor in Wisconsin. He is Mr. J. G. Moore of Albion, Wis., and his work is under the direction of the Dairy and Food Commissioner, Mr. J. Q. Emery.

Fifth. In order to enter the Wisconsin dairy school, a man should have at least five month's experience in some creamery or cheese factory before he can attend the winter term of the school which begins Nov. 4th. We have, however, a summer dairy school which may be entered any time after March 1st. Previous experience is not required of students entering this summer school.

A WISCONSIN HERD OF HEIFERS
Property of J. M. WAGNER, Hillsboro, Wis.

DINNER TIME ON A HOLSTEIN FARM

Your sixth question I have already answered in the fifth. The fall or winter term of the dairy school begins November 4th, 1903.

AVERAGE MILK PRODUCTION OF STOCKYARD HEIFERS.

I own a farm in Clark County, Wisconsin, and on it there are twenty-eight heifers, common stockyard stock. These cattle are two to two and a half years old, and will come in fresh next spring. Can you inform me what is the average yield of milk from such cattle the first milking year? Also how many pounds of cream may be expected from 100 pounds of milk. I should also like to know if possible the average price paid for a pound of cream in Wisconsin. H. J.

Chicago.

It is impossible to give a very definite answer to your question in regard to the probable yield of the cows you describe. We have tested the milk of cows supplying creameries in Wisconsin, and find that there is a great variation in the annual production. Young cows raised on the farm without any special attention to their selection or breeding, usually give about 3,000 lbs. of milk in a year testing about 4.0 per cent butter fat. This will amount to about 130 pounds of butter. One of the tested two-year-old heifers, belonging to farmers, gave 1,900 pounds of milk in a year, while another gave nearly 4,000 pounds.

The difference in milk production is influenced very much by the length of the milking period. Some heifers, as well as cows, are persistent milkers, and even if they do not give very much at one milking will keep up their milk flow for about three hundred days in the year, and this helps out their total annual production. Other heifers will not give milk for much over one hundred days in a year. I do not think it is possible to form a very close estimate beforehand of the amount of milk and butter which heifers will produce, but their first year's record will give some basis on which to judge of their future milking possibilities.

POUNDS OF CREAM FROM 100 LBS. MILK.

The number of pounds of cream that you may expect to obtain from 100 lbs. of milk will naturally vary with the richness of the cream. You may safely estimate that in every 100 lbs. of milk you will have at least 3.7 lbs. of fat. This will make—

24 pounds of cream testing 15.0 per cent fat
18 " " " " 20.0 " " "
15 " " " " 25.0 " " "
12 " " " " 30.0 " " "

You will notice from this caculation that you may easily find out how much cream can be obtained from 100 pounds of milk, if you know the test of the milk and the richness of the cream you want.

The average price paid for a pound of cream in Wisconsin is not a question that can be definitely answered. This, like the former question will depend a great deal on the richness of the cream. You may solve this problem in a fairly satisfactory way by assuming that the Elgin price of butter is paid for one pound of fat. From this you may calculate how much a pound of cream is worth by determining the richness of the cream and the market price of butter at any given time. At present the Elgin market price of butter is 21 cents. If a pound of cream contains 20.0 per cent fat there will be .2 lbs. of fat in it and the price per pound of cream will be 21 .2 which gives 4.2 cents. This is about the price that may be expected to be received for cream at factories where it is made into butter. E. H. FARRINGTON.

Wisconsin Dairy School.

Cows Bloating on Alfalfa Pasture.

ED. HOARD'S DAIRYMAN:—The DAIRYMAN has often requested its readers to write about their experience, but I have always hesitated to do so. But lately something happened in my herd that I consider my duty to report about, so the farmers, and particularly those with alfalfa fields, may take warning.

After harvesting four good crops of alfalfa hay I let the milk cows have the field for pasture. Where the first cutting was done, the young alfalfa was about 15 inches high. I was careful to let them in when it was dry and watched them all the time, because I had lost a good cow by bloating on alfalfa about a year ago. The cows got in at first on the 26th of September, and on the morning of the 29th the milker, when getting the cows out to the stable, found one young cow on her back, dead. After this I kept them out at night, thinking that the dew had caused it.

October the 3rd, I was away from home, but before I left instructed a young

man to watch the cows well, and in case of necessity, use the trocar. The day was very dry, no dew whatever, and the cows were driven off of the field at 5.15 p. m. with no signs of bloating, and then left for the night on a bare field adjoining the barn yard. When I arrived home at dark I was told by the young man and also by the milker that everything was all right. The next morning (or rather night when the cows are taken from the pasture regular at 1 a. m.) when the cows were turned in, there were two cows dead again.

Now I was watching those cows closely most all the time, carrying even the trocar with me, and while I was with them, never noticed the least sign of bloating. The cows never went hungry in the field, because they were fed before hand. I have pastured the cows on alfalfa occasionally for the last ten years and have lost the first one last year and three this year. The greatest danger with it is, that it happens when at least expected.

One of the cows I lost was in her 14th year, but such a good dairy cow, that I think it worth while to enclose her 9 year's record. This is copied from my yearly records, which are based on monthly averages. In the winter 1896-97, the *Ohio Farmer* requested its readers to send in some dairy reports. I did so, too, and will enclose the following copy of mine as then published.

BLACKIE'S RECORD FOR 9 YEARS FROM APRIL 1ST 1894, TO DATE, 1903.

	Lbs.	In milk months.	Net receipts for milk.	Received for calves.
1895	5880	10	$79.58	raised heifer
1896	6870	10	92 92	6 17
1897	7950	11	107 53	5 00
1898	9510	11	129.19	raised bull
1899	8190	10	99 96	1 50
1900	10350	12	126.31	3 00
1901	8849	10	108.04	raised bull
1902	6750	10	82.42	1 50
1903	8310	10	100.80	1 50
Total	72659		$926 75	$18 67

Yearly average, 8073 lbs. equals 938 quarts.
The price received for milk varied from 11½ cents to 10½ cents net.

Total receipts for 9 years for milk and calves sold		$945.42
Average yearly receipts for milk and calves sold		$105.05
Average cost of feed for 9 years at per year	$36.00	$324.00
Average cost for labor for 9 years at per year	$16.00	$144.00
Average cost for feed and labor	$52.00	$468.00
Total profit for 9 years above feed		$621.42
Total profit yearly average feed	$69.05	
Total profit for above feed and labor		$477.42
Total profit above yearly average labor	$53.05	

That then was my first writing to an English paper and this is the second. I don't care much to write about my farm operations, but in this case of bloating I felt it my duty to report, because a good many farmers are pasturing alfalfa, who are not aware of the danger of it.

In regard to the record will say that I have simplified the figuring by multiplying the different milkings by 60, and for reducing to gallons divide by 8.6.

I have noticed that the Illinois Experiment Station and a few others have lately published reports based on averages something similar to mine. Now, Mr. Editor, if you can find anything in this that may benefit some of your readers, you are welcome to publish it.

HENRY F. PINKVOSS.

Hamilton Co., Ohio.

A War Against Butter Color.

The oleo manufacturers, finding that they cannot violate the law except at heavy cost in fines, are looking for other means of inducing the public to buy their product. It is evident that if the public can be induced to believe that only uncolored butter should be used, then uncolored oleo would come into competition with uncolored butter and the oleo fraud would be again in full swing.

The following extract from the *National Provisioner*, shows how the crusade is to be carried on:

"The manufacturers of oleomargarine who have felt the business nudge of the secret of natural color now realize that time has been lost in the endeavor to push the manufacture of a product yellowed with selected rich cow fats. The process is expensive to obtain the yellow shade by natural coloring. Any other process of securing the tinge has failed or resulted in unpleasant controversies with Uncle Sam. The *National Provisioner* advised

CONVINCING EVIDENCE

THAT THE U. S. IS THE BEST AND MOST POPULAR SEPARATOR

ROCHESTER, MINN.,
Sept. 2, 1903

I have handled the U. S. Separator for the past five years. The first year I sold about 46 machines. Looking over my books this spring, five years later, I find there are 30 out of the 46 sold the first year that have cost their owners *not one cent* for repairs during the five years they have run them.

Altogether I have sold about 270 U. S. Separators.

P. D. ANDERSON KEEL.

THE U. S. SEPARATOR PLEASES OTHERS AND WILL PLEASE YOU IF YOU WILL GIVE IT AN OPPORTUNITY

If interested write for catalogue

We transfer our separators from Chicago, La Crosse, Minneapolis, Omaha, Sioux City, Hamilton, Ont., Montreal, Sherbrooke, and Quebec City. Address all letters to

Vermont Farm Machine Co., Bellows Falls, Vt.

The "Pioneer"

That's the name of a brand of parchment wrapping for the preservation of butter that goes before every other article manufactured for the purpose.

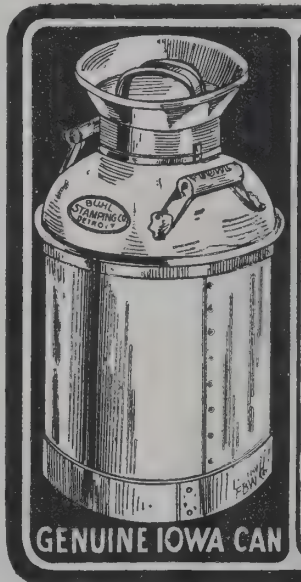
Pioneer Brand
Parchment Paper

keeps the delicate flavors in and prevents butter from absorbing the foreign odors it meets in commission house, cellar and shop. Has no taste or smell to impart—pure vegetable parchment, tougher wet than dry.

Don't Mistake the Brand.

There are papers made in imitation. The *"Pioneer"* is the original wrapping which put the cotton or linen cloth out of business. It differs from so-called parchments in that it is a vegetable product instead of rags and paper. Sheets for print wrapping, box and tub lining. Name or brand on sheets when desired. Write for free samples and interesting book, "Better Butter."

The Paterson Parchment Paper Company,
37 Eighth St., Passaic, N. J.



Spain's Churn

Hand made of thoroughly seasoned white cedar. Has large opening. Never gets water soaked or sours. Easy to clean. Simple to operate. A 30 years' test has proved it the best. Everything for the dairy or creamery—automatic milk scales, glass jars, butter workers, printers, shipping boxes, etc. Send for illustrated catalog of "Bestov" dairy supplies.

St. Jacobs Oil

The World's Greatest Remedy for Aches and Pains.

the butterine trade to wage its war on artificially colored butter and to carry that war right to the consumer. By thus unmasking butter and at the same time planting in the consumer's mind the value and tint of a natural oleomargarine product, the taste for the combined substance would be both cultivated and cuddled. One or two concerns did this in localities and found that it was the correct tack. The fight to a finish has to be either in Congress or on the public taste. It might cost something to wage a color war on butter, but it costs to sell oleomargarine as some makers sell it at present, fighting food inspectors and court cases, whether the grounds of the prosecution are legal or not. If the fight were shifted from color to the product the battle would turn more easily to the steer butter."

Salt and Butter Color.

ED. HOARD'S DAIRYMAN:—I am startting to make butter on a small scale and have a small separator, but am in some little doubt about the working of the butter.

Could you tell me how much butter color to put in the cream from an average of 1,000 pounds of milk?

Also, how is the best way to gauge the salt, to either weigh the butter and put in so much salt to the pound or 50 pounds, or to put in salt by gauging it with the cream? Also state amount of salt either way. A. N. D.

Glen Flora, Wis.

The amount of butter color which should be added to cream in order to give butter the acceptable shade most desired by consumers, will vary from one-half an ounce to three ounces of color per hundred pounds of butter fat.

At the present time (October) the color desired by the western market may be obtained by adding one ounce of butter color to each 100 lbs. fat. During the winter, when cows are fed nothing but dry feed, double this amount of color must be used, and in June it is sometimes unnecessary to use any color if the butter is sold in the northern markets.

The color of butter is, to a certain extent, a fad; different sections of our country prefer different colors. In the south people like a highly colored, deep yellow butter, but in the east and north a light straw shade suits the butter consumer better. The butter maker must, therefore, keep these two things in mind, first, to furnish butter of a color that suits the market supplied, and second, to increase and diminish the amount of color with the amount of green feed the cows receive.

The most important consideration in coloring butter is the preference of the consumer. If the shade of color you are making does not exactly suit your trade add more or less color, as the case may be, until your customers get what they want.

The general market will, as a rule, permit a slightly low or a trifle highly colored butter to pass without complaint, but any striking deviation from the commonly accepted color of butter for a given market will be objected to.

Butter color is used in such small quantities that it is a good plan to have a cylinder graduated into cubic centimeters for measuring it. This will permit a finer division than the ounce graduates and enable one to measure the color accurately each time it is used.

One fluid ounce is nearly 30 c. c., and if one ounce or 30 c. c. of color must be added to 100 lbs. of butter fat, the amount needed per 1,000 lbs. of milk may be estimated by finding out how much fat there is in 1,000 lbs. of milk. If the milk tests 4.0 per cent fat it will contain 40 lbs. butter fat and since the standard amouut of color to use is .3 c. c. per 1 lb. butter fat, the 40 lbs. fat will need 12 c. c. butter color. You will therefore need at the present time about 12 c. c. butter color per 1,000 lbs. milk.

SALTING BUTTER.

The standard amount of salt to use in butter is universally said to be "an ounce to the pound." This is a good rule to start with, but you cannot always be sure of having butter uniformly salted when the same proportion of salt to butter has been used. The amount of salt retained by the butter will vary with the amount of working each churning receives, and also with the dryness of the granular butter to which the salt is added.

When butter is allowed to drain in the churn a long time before salting, the granules will be so dry that a given amount of working will not remove so much salt as will be squeezed out from butter that had not been allowed to drain so thoroughly before salting it.

The size of the salt crystals must also be considered, as a fine grained salt will work out of the butter faster than a coarse grained salt.

A buttermaker must use good judgement in salting butter and take into consideration the size of the butter granules. When the churning is stopped, he should also notice the amount of moisture with the granules or the dryness of the butter and the fineness of the salt used.

When these factors which influence the retaining and the washing out of the salt are well understood, the buttermaker is able to make very uniformly salted butter in his different churnings.

In order to find out how much salt to add to each churning of butter, it is a good plan to weigh the granular butter after it has been washed, and then from the weight obtained calculate how many ounces of salt are needed and add this salt to the granular butter through a sieve.

If the weights and test of the cream churned each time are known, the salt needed for the butter may be easily estimated by adding about fifteen per cent to the weight of butter fat, and then weighing out as many ounces of salt as the pounds in weight found by such a calculation.

If you have 50 lbs. of cream testing 20 per cent fat, the pounds of fat in the cream is found by multiplying the cream by its test, this gives 10 lbs. fat; now add 15 per cent to this and we have 11.5 lbs. This is very nearly the amount of butter that should be made from the cream, and you will therefore need 11.5 ounces salt to add to the butter when it comes, in order to have it salted as usually desired by the general market.

E. H. FARRINGTON.

Wisconsin Dairy School.

Much in Little.

There is a good deal of meaning, one way and another, conveyed in the following letter which the writer sends us in response to a circular inviting him to renew his subscription:

ED. HOARD'S DAIRYMAN:—I see you are determined that I shall "take it." I really don't need it. I only milk 10 cows (scrubs), make about 80 lbs. butter a week; sell for 35 cents, or 3 pounds for a dollar. Have not fed anything but grass since last May. I use the separator, and churn every day; ripen the cream to about 70° and churn at 58°, wash in two waters. I sell most of the butter without salting. My neighbors get 25 cents, the same price they received years ago when clover hay sold for $3 to $4 a ton and bran at $7 to $12 a ton. Now prices are as follows: Clover hay, $8 to $12 per ton; bran, $15 to $20 per ton; corn, 50 cents a bushel. H. C. D.

Jackson Co., Mo.

"ADVERTISEMENT."

A FOOD RESCUE

What a Physician's Wife Found Out

The wife of a well-known physician of Oakland, Cal., was brought back to health and strength by food alone at a time when she had prepared to die.

She says of her experience: "I am the wife of a physician and have suffered from catarrh of the stomach more than ten years during which time I suffered untold agonies of mind and body for I could not eat solid food and even liquid foods gave me great distress.

"I was brought at last to confront the crisis of my life. I actually made ready for my departure from friends and husband for I expected to die. When in that state I was induced to try Grape-Nuts and the wonderful effects of this food prove completely that all my trouble was due to improper feeding.

"I began to improve immediately and my weight increased until I have gained 20 pounds since I began the use of Grape-Nuts while my stomach is as sound and well as ever it was and my husband gives all the credit for my wonderful recovery to Grape-Nuts. I have no set time for eating Grape-Nuts but just feast on it whenever I please. I wish I might tell my sisters everywhere of the marvelous health and strength giving, flesh building elements of Grape-Nuts." Name given by Postum Co., Battle Creek, Mich.

Look in each package for a copy of the famous little book, "The Road to Wellville.

WILL IT PAY YOU TO TAKE HOARD'S DAIRYMAN?

W. H. Jenkins took a census in 1901 of 50 farmers who were patrons of the creamery in Montrose, Pa. Twenty-five of them read dairy papers; twenty-five did not. The twenty-five who did read dairy papers averaged $50.23 per cow for the year. The twenty-five who did not read averaged $32.95. Here is a difference of $17.28 per cow. Did it pay the twenty-five to read? Did it pay the other twenty-five not to read? That's not all. Those who did read averaged a profit over cost of food of $15.06 per cow. Those who did not read averaged a profit of 66 cents. Is not that dairy farmer standing greatly in his own light who will not pay 2 cents a week for Hoard's Dairyman? These are hard facts worth thinking over.

COMING EVENTS.

Indiana State Dairymen's Meeting, Plymouth, Dec. 10-11, 1903.
Minnesota Dairymen's Association, Fairmont, Dec. 15-17, 1903.
Vermont Dairymen's Association, St. Albans, Jan. 5-7, 1904.
Illinois Dairymen's Association, Greenville, Jan. 5-7, 1904.
Wisconsin Cheese Makers' Association, Milwaukee, Jan. 6-8, 1904.
Ohio Dairymen's Association, Columbus, Jan. 27-29, 1904.
Wisconsin Butter Makers' Association, Feb. 2-4, 1904.
Maine Dairy Convention, Foxcraft, Me., Dec. 2-3, 1903.
New Jersey Agricultural and Dairy Convention, Trenton, N. J., Jan. 14 15 and 16.
Eastern Ontario Dairymen's Convention, Belleville, Ont., Jan. 5, 6 and 7.
Missouri Dairymen's Meeting, Clinton, Dec. 8-10, 1903.
Iowa Dairymen's Association, Waterloo, Nov. 18-20.
Washington Dairymen's Association, North Yakima, Dec. 29-31.
Massachusetts Creamery Association, Greenfield.
Connecticut Dairymen's Association, Hartford, Jan. 20-21.
Oregon's Dairymen's Association, Corvallis, Dec. 15-16.

SAMPLES of cheese made by substituting pepsin in place of rennet have been received from Prof. Vivian, of the Ohio State University. The cheese is of fine quality, with nothing to distinguish it from the usual rennet made cheese. A pepsin cheese took first prize at the Ohio State Fair, with a score of 98, and it is stated by Prof. Vivian that several hundred pepsin cheese have been made and put on the market with no complaints as to quality. It is too soon for any definite opinion to be expressed on the practical value of this change from rennet to pepsin. Pepsin undeniably makes a cheese of excellent flavor, with no indication of any off flavor on keeping; and there is an advantage in the fact that pepsin can be obtained of uniform strength, which is not the case with rennet, and also pepsin is comparatively free from molds and bacteria.

Whether these advantages will be sufficient cause for a change in methods can only be determined by the future. Both methods make good cheese.

ANOTHER CONTRAST.

No matter how valuable a paper an editor may make, he cannot hope to please everybody. The daily correspondence of the DAIRYMAN office shows up human nature in a highly variegated shape. Here is an example: A man at Auburndale, Wis., writes us that he knows all about dairying now; that there is nothing for him to learn, and he won't have the paper. Is he not just the man to put on the Editorial Staff? Where else could we find a man who knows all about dairying?

Another man, at Wickersham, Wash., writes that the reason he let his paper run out, was because he never took time to look at the label on the wrapper; he is so anxious to get to the reading of it. He calls the DAIRYMAN his "business partner" Another, from Eugene, Oregon, says the paper has proved to him "the best all round farm paper" he ever took.

So it goes, and the old adage "What is one man's meat, is another's poison," seems to be one of the old things that keep fresh and new all the time

COST OF MILK PRODUCTION.

This is always a most important question. It is the only end of the question that the dairy farmer has any control of. The price he is to receive is far beyond him, in the market, governed by forces and conditions over which he has but slight if any control. But a penny saved in cost, is just as good as a penny gained in price, although most farmers pay but little attention to that end. Every instance where the food cost of milk has been reduced is therefore valuable knowledge for the man who is striving to increase his profits. HOARD'S DAIRYMAN has always paid especial attention to the digging up of facts bearing on this matter of the cost of production. One very quaint old New England farmer once wrote us that he "valued the DAIRYMAN very much because it kept up with the procession, so us fellows back in the rear could learn what was going on at head of the column". We will warrant that that old Yankee was once a soldier.

In "Canadian Dairying" Prof. Dean states that:

"The average food cost of milk in the Ontario Agricultural College Herd, for three years (1896, 1897 and 1898) was 46 cents per 100 pounds. The average cost of food to produce one pound of butter was 10½ cents, and the cost for one pound of cheese was 4.85 cents.

For six months (May to October) the average food cost of one pound of butter was 8.88 cents, and for one pound of cheese it was 3.96. For the six winter months (November to April,) the average food cost of one pound of butter was 12.65 cents and for 100 pounds of milk it 58.3 cents.

In this connection he says:

"We found a marked difference in individual cows with reference to economy of production. Some cows produced milk more economically than did other cows which excelled in smaller cost for the food to produce a pound of butter. It will be noticed that the difference between the cost of butter and cheese (10½ and 4.85 cents) was not near as great as is generally supposed.

At the ratio of two and a half to one, the butter should have cost 12.11 cents. It has been generally asserted that the milk that will make a pound of butter will make two and a half pounds of cheese.

Prof. Dean is eminently sound in calling attention to the fact that a good cow makes a very great difference with reducing the cost of milk. For that very reason all well posted dairy farmers pay great attention to the breeding of a good cow. Blood lines tell.

The Education of Farmers' Sons.

In that most useful magazine, the *World's Work*, August number, is a most excellent article, written by Mr. Clarence H. Poe, on the education of farmers' children. He quotes from one of the prominent Professors of Agriculture in this country, as follows:

"Statistics show in this state each year 60 young men take up the ministry, 66 law, and 72 medicine, while 13,000 annually take up agriculture as a gainful pursuit. But our school books are written for the few and not the many * * * Put such words as phosphate, protein, nitrogen, etc., in our spelling books and they will not be as meaningless as Greek and Latin to adult farmers. Let nature-lore give freshness to our reading books, and the mass of country boys will not be blind to every day life about them. Let our arithmetics apply addition, subtraction, percentage and fractions to agricultural problems and the farm boy will see the need of education as a preparation for his own life work. At present, however, the entire curriculum leads away from the farm."

The *Ohio Farmer* makes the following comment on this article:

"Not only is there no instructipn in elementary agriculture, but the ordinary text books ignore or avoid application in this direction. Attention is called to the fact that our arithmetics give plenty of space to common mechanical trades such as plastering, stone-work, carpentering, gauging, lumber measuring, etc., and to banking, commission, foreign exchange and commercial affairs generally, but very little to rules and examples that apply directly to the farm operations. In no arithmetic can you find anything relating to the compounding of rations or fertilizers. Such examples as the following, the writer says, would be of far greater practical value than those relating to stocks, bonds, insurance and banking.

1. "Calculate the value of a ton of fertilizer containing 2 per cent nitrogen, 8 per cent phosphoric acid and 2 per cent potash, nitrogen being worth 14c a lb., phosphoric acid 4c and potash 2c.

2. "Two cows produce, each 5,000 lbs. of milk a year. The butter fat test of No. 1 is 4.6 per cent, and of No. 2, 6.3 per cent. With butter selling at 25c per pound, how much greater is the income from No. 2 than from No. 1; 6 pounds of butter fat being equivalent to 7 pounds butter?

3. "Calculate the nutritive ratio in a feeding ration containing 3 lbs. digestible protein, 1 pound fat and 14 pounds carbohydrates.

"Now these are practical examples, such as the farmer is called upon to solve, and such as he should know how to solve, and for mental discipline, the drill in figures, are just as useful as the great mass of problems in our arithmetics that will never be of any direct practical use to the farmer boy. Indeed, it has become absolutely necessary to drill the boy who is to be a farmer, in computations relating to the compounding of rations and the mixing of fertilizers, as well as in the ordinary computations necessary to a proper understanding of arithmetic. Our schoolbooks, for rural schools, need revision, and a text book on elementary agriculture should be introduced, so that the prospective farmer can be equipped with the knowledge that now is essential to success in agriculture, and will leave school with enlarged ideas and greater appreciation of country life and scenery, and fully prepared to make good use of the information that is conveyed through agricultural books and papers, station reports, and institute lectures."

It is to meet just this very difficulty that the state of Wisconsin has provided for a limited number of county agricultural schools. Two of these schools have been established, one each in the counties of Dunn and Marathon, and the last legislature provided for the establishment of two more.

It is a grand scheme and one which we believe will result in a splendid advance in the intelligence of farmers' sons wherever such schools are placed. In addition, training schools for teachers of country schools have been created by virtue of state legislation, in several counties in this state. One especial object of these latter schools is to train and equip country teachers to impart knowledge concerning the elements of agriculture, as that is now one of the conditions for obtaining the certificate authorizing their employment as teachers It is important that such elements should be taught in a manner that will help the farmer's boy to grasp the meaning of the terms which are used in farm literature, giving him an understanding of the foundation principles that underlie the processes that he must deal with as a farmer. In this, as in many other things connected with agriculture, Wisconsin is taking a leading part. HOARD'S DAIRYMAN was the first journal in this country to press that greatly needed teaching reform.

Advantages and Disadvantages of Pasteurizing Milk.

The chief advantages of pasteurization for butter making are:

1. It destroys the germ life of milk or cream to a large extent, especially when heated to 185 degrees, which is the temperature to be recommended. A clean seed-bed is thus prepared for the proper germs to give fine flavor to the butter.

2. It tends to eliminate stable and feed flavors from milk and cream, especially with milk in winter.

3. The ripening of the cream may be controlled by the butter maker, which is the important point in making good butter.

4. In case of bad flavored milk, it enables the butter maker to improve very much the quality of his goods.

5. By the use of pure cultures (commonly called "starters") a more uniform quality is produced from day to day throughout the year.

6. The butter possesses an improved keeping quality, hence is better suited for the export trade, as our butter does not reach the consumer for two to four weeks after being made.

7. An improved quality of butter may be produced at cream-gathering creameries by pasteurization of the cream when sweet. The pasteurization of sour cream is attended with more labor and more difficulties, and the results are not so good. It is difficult to pasteurize milk or cream which contains more than 0.1 per cent of acid. However, after natural coagulation takes place in the cream, which will be when it contains 0.4 to 0.5 per cent of acid, the work may be done fairly well but is usually attended with considerable loss.

8. There is less loss in the skim milk when the whole milk is pasteurized before separating, especially in winter. We have used nearly all the leading makes of separators for creaming hot milk. The upper bearing of the machine needs to be somewhat more loose than when running through milk at a temperature of 100 degrees, and plenty of good oil is required to lubricate the bearing when separating pasteurized milk.

9. A better quality of skim milk may be returned to the farmers by sending it home hot. There is also less danger of spreading disease. In Denmark all skim milk and buttermilk must be heated to 180 degrees before it is returned to the farmer. This plan has materially lessened the spread of tuberculosis in that country. Hydrogen peroxide is used to test whether the dairy products have been pasteurized, and the law is rigidly enforced.

The disadvantages of pasteurization are:

1. The extra cost of labor and machinery to heat and afterward cool the milk or cream. A milk pasteurizer that will heat milk for two power separators will cost $150 to $200.

2. There is difficulty in pasteurizing milk or cream which is "overripe," and this may cause trouble in hot weather, when milk or cream is not properly cared for and cooled at the farm and is delivered in poor condition.

3. Some trouble is experienced from the froth which rises on the milk as a result of heating. No practicable remedy for this has yet been discovered.

4. There is a tendency to lack of flavor, and sometimes there is a slightly "cooked" flavor as a result of pasteurization. The cooked flavor usually disappears in less than two weeks. Lack of flavor is objectionable in local markets.

Two points are essential if pasteurization is practiced—proper means of heating and cooling the cream and the use of a proper culture to give the desired flavor to the cream and butter. Commercial cultures should be propagated three or four times in pasteurized skim milk before they are used in cream for ripening, in order to get the best results.—*Canadian Dairying.*

California Notes.

ED. HOARD'S DAIRYMAN:—Your valuable paper at hand. I dare say that there are probably very few, if any, who own only one cow, who read your paper with the interest I do. Yet, being in the professional field and making my living by keeping informed on the best and latest methods of all concerning stock and their products, it may be rather egotistical in saying for one paper alone, its a doubtful case, if there is another stock paper printed to-day, that will give the reliable information HOARD'S DAIRYMAN will. It is a great pity that Californians are rushing past so much real knowledge.

I scarcely mention your paper without one of the following answers: I take it but get no time to read it," "I take it, but there is so much theorizing. What we want is work." "If we could get men for $18 to $25 per month like at the East, we could make money."

In many instances, you will find the manure thrown out of a window, under the eaves for all the virtue to wash out, then spend a week hauling out nothing in the fall. They do not take out manure in the spring here. A quart of mud and manure in the bottom of a milk cooler of sixty quarts is common.

Carcasses of dead cows, horses, hogs and other animals left around the ranch are common. Even a month ago, a fellow who through a pull got appointed inspector of stock, had a horse shot, proclaiming the animal suffering with glanders; towed it out to the harbor entrance, turned it loose to wash ashore, when the law says cremate in all such cases.

Again, a dairy of 30 head was condemned as tuberculous just by the eye, the creamery given orders not to accept the man's milk. No doubt some were bad, yet without the tuberculin test no one could be safe in saying they all were. Still we are slowly on the up grade. The Run estate has put in five silos of 100 tons capacity each, one is for one of their large dairies of 200 cows, the other four for feeding beef cattle. They have filled them with wild grass, corn, barley, clover, and rye grass.

Mr. Run since getting the analysis of corn will fill no more with it; too deficient in protein. This gentleman informs me that their firm will build more silos. They have had several years experience. Their style is cement bottom, 2x6 studding, 26 feet high, 20 feet in diameter, boarded around with half-inch boards, a double boarding break joint, tarred paper between, 18 inches between the studding, redwood lumber used. The stock silos are in the feed barn; the dairy silo is outside of the barn, as it should be. These are probably the only two barns in the county built on sanitary basis, viz concrete gutters, concrete vat, away from the barn, wagon made to sprinkle the manure on the land in a liquid form.

Buhne Dairy is one that supplies milk to the city of Eureka of 12000 inhabitants. The promoter of the concrete gutter system was a Hollander named Helflicker The other is Fred Cornick's cow barn on McDermitt Prairie.

The butchers ran an advertisement in the *Ferndale Enterprise*, a paper with some 2,500 subscribers, as follows: "We the undersigned will not pay for animals that prove on butchering to be tubercular or otherwise diseased." We have about 12½ per cent of tuberculous dairy stock at present, while Marin county, the oldest dairy county, except Del Norte in California, has as high as 20 per cent.

I read Buff Jersey's letter in Oct. 16th. What grand talks a person could have with him. He is right on the corner proposition. We have three square silos in Humboldt all discarded; rot in the corners the cause.

A. P. Martin of Petaluma had the first square silos in the state, composed of concrete, two of them. He has a redwood one now, of the round style 20x20; stud and board with ½ inch board doubled. Corn matures well there. Mr Martin uses corn for ensilage; figures it in silos at 50 cents a ton. Many silos went up in Sonoma county the last two years.

I will say for the benefit of the Jersey's friend, H. I. Van Duzer of Loletta showed 388 pounds to the cow, for 80 head; Geo. Gries for 30 head shows 400 pounds and over. He will use only Jersey blood. Yet the beef men don't wish to buy Jersey calves, and consequently dictate what bull dairymen can do best with, when they get $8 to $10 for a Durham calf and $5 to $6 for a Jersey. They don't figure the difference between 200 lbs. of butter and 400 lbs. That article from the pen of A. S. Alexander V. S. of Wisconsin Agr'l Experiment Station is worth several years subscription alone.

Arcata, Calif. B. A. F.

A neatly mowed lawn, and buildings kept painted and in good repair on a dairy farm do not necessarily mean the produc ion of clean milk, but they indicate the thrift and industry so essential to successful dairying.

The Reason Why Cold Aids in Preserving Milk.

Dairymen at the present time understand that milk is sure to contain bacteria, in greater or less numbers, and that these bacteria are the cause of the various changes characterizing the spoiling of milk. It is the type of bacteria known as lactic bacteria that is responsible for the souring of milk, and all of the other changes which are liable to prove troublesome to the dairyman, slimy milk, bitter milk, etc., etc., are to-day well known to be due also to bacteria in the milk. It is not simply the presence of bacteria in the milk that produces these changes, but rather their growth and multiplication. If they did not multiply at all, the milk would not sour; the more rapidly they multiply, the quicker the changes of the milk take place; the longer the growth may be delayed and the slower it is, the longer the milk may be retained in its fresh condition. These facts are fundamental phenomena associated with the keeping of milk, and every milk man should therefore understand as a foundation of dairy practice, that the keeping of milk is dependent upon preventing or checking the multiplication of bacteria, rather than upon simply preventing their presence in milk.

A second fact which is not so thoroughly appreciated, but is equally true, is that the rapidity of growth of all species of bacteria is dependent upon temperature. Within certain limits, the rate of multiplication rises with the increase and falls with the decrease in temperature. At a temperature of freezing, bacteria do not grow at all, and milk, therefore, if frozen, may be kept indefinitely without any changes taking place therein.

If the milk is kept at a few degrees above freezing, the growth of bacteria begins, but at low temperatures this growth is extremely slow. As the temperature rises, the rapidity of bacterial growth increases. When the temperature reaches 70°, bacteria grow very rapidly; at a temperature of 80° to 90° they grow more rapidly still; and at a temperature of about 100°, the growth of some species of bacteria is most rapid of all.

All this is generally understood, but it is not generally recognized that if the temperature is raised somewhat above these higher limits, the bacteria do not grow so rapidly. If the temperature is raised to 120°, most of these organisms find conditions unfavorable to their life, and grow very slowly; indeed many of them cease to grow at all. At temperatures above this the ordinary milk bacteria entirely fail to develop. From these facts it will be seen that in general the growth of the kinds of bacteria that produce trouble in milk, will be found between temperatures of freezing and a little above 100° F., and that the greater the temperature, within these limits, the more rapid is the development of the bacteria, and hence the more rapid the spoiling of the milk.

From these facts of course it follows that the keeping of milk will be very closely dependent upon temperature. At high temperatures (90°) milk will sour very rapidly. At somewhat lower temperatures (70°) the souring is not quite so rapid, but still it takes place in a comparatively few hours. At lower temperatures still, in the vicinity of freezing, the souring and all other changes may be delayed for a long time; and if milk can be frozen, it may be retained indefinitely without any appreciable change taking place in it.—*Storrs Experiment Station Bulletin.*

Butter Tests Accepted for Publication by the American Jersey Cattle Club, Oct. 20, 1903.

Blue Belle Princess 157364—Sire, Blue Boy P. S. 2578 H. C; dam, Beautiful Nora 157313. Butter, 15 lbs. 1 oz.; milk, 242 lbs. 3 oz. Test made from May 22 to 28, 1903; age, 3 yrs. 10 mos., estimated weight, 900 lbs.; fed 21 lbs. corn meal, 21 lbs. ground oats and 14 lbs. bran, pasture of mixed grasses.

Elma Genevieve 149010—Sire, Marigold Pogis 38752; dam, Ida of Oakland 2d 72061. Butter, 15 lbs. 11 oz.; milk, 240 lbs. Test made from June 25 to July 1, 1903; age, 3 yrs. 10 mos.; actual weight, 900 lbs.; fed 9 qts. bran, 6 qts. ground oats, 6 qts. gluten feed and 1½ qts. oil meal, in slop, daily, fair pasture.

Elma Genevieve 149010—Fourteen days—Sire, Marigold Pogis 38752; dam, Ida of Oakland 2d 72061. Butter, 30 lbs. 5 oz.; milk, 470 lbs. 10 oz. Test made from June 18 to July 1, 1903; age 3 yrs. 10 mos.; actual weight, 900 lbs.; fed 9 qts. bran, 6 qts. ground oats, 6 qts. gluten feed and 1½ qts. oil meal, in slop, daily; fair pasture.

Fancy Reber 140825—Sire, Romp Ogden 5th's Harry 34640; dam, Ruby Fair 84594. Butter, 16 lbs. 11½ oz.; milk, 271 lbs. 13 oz. Test made from July 28 to Aug. 3, 1903; age, 6 yrs. 4 mos.; estimated weight, 950 lbs.; fed 2 lbs. oil meal, 6 qts. ground corn and oats, 5 to 6 qts. bran, 2 pks. sweet corn in husk and 2 gals. apples, daily, clover and timothy pasture.

Gertie Hugo 159747—Sire, Gen. Jamont 422212; dam, Louise Hugo 86399. Butter, 15 lbs. 4½ oz.; milk, 252 lbs. 8 oz. Test made from July 19 to 25, 1903; age, 2 yrs. 10 mos.; actual weight, 775 lbs.; fed 9 qts. bran, 6 qts. ground oats, 4 qts. gluten feed and 1 qt. oil meal, daily; fair timothy and clover pasture.

Gertie Marigold 160735—Sire, Stoke Pogis of Prospect 29121; dam, Gertie of Glynllyn 74474. Butter, 15 lbs. 6 oz.; milk, 233 lbs. 14 oz. Test made from July 24 to 30, 1903; age, 2 yrs. 10 mos. actual weight, 740 lbs.; fed 9 qts. bran, 6 qts. ground oats, 2 qts. corn meal and 1 qt. oil meal, in slop, daily; fair clover and timothy pasture.

INQUIRIES AND ANSWERS.

Every inquiry must be signed with the name, Post-office and state of writer. Condence the questions into plain epecific inquiry. Be careful to note if your questions eave not been answered in replies to others. We are glad to answer all the pertinent questions that we can concerning machinery. Look over our advertising columns and write to the advertisers.

Ground Rye for Cows.

I would like to know if ground rye is good for cows, mixed with corn, oats and bran, and if so, what proportion of each? L. V.
Savona, N. Y.

There is no valid objection to the use of rye for feeding milk cows, unless it be the remote possibility that it may contain enough ergot to produce abortion. This is seldom, if ever, the case. At the last convention of the Wisconsin Dairymen's Association Mr. Howie reported the feeding of boiled rye as the exclusive grain feed for a herd of royally bred and profitable milk-producing Jerseys.

Make half in weight of the proposed mixture bran and oats and the other half corn or rye, or both, and if it costs less to boil than to grind the rye, try feeding it boiled.

A Maine Feeding Inquiry.

I am starting a dairy farm here. Kindly write what grain ration I can give the cows to produce the most butter fat. G. P. C.
Bucksport, Me.

The kind of grain to feed in any case or at any time, to any kind of animal, will depend (1) upon what kind of roughage is available, (2) the prices of the different kinds of roughage and grains, and (3) upon the kind and amount of work the animal is expected to perform. The cow that produces her total live weight in milk every six weeks is hard at work and should be fed accordingly. If this inquirer can furnish us with information along the lines indicated, we shall be more than glad to offer suggestions as to the best and most economical methods of feeding.

Best Breed of Cows.

What breed of cows do you consider best for butter, and raising calves and pigs from skim milk? H. C. G. A.
Sullivan Co., N. Y.

It is a difficult matter to answer such a question as this satisfactorily. In the first place, it is not the province of an editor or teacher or preacher, to put much emphasis on his personal preference, or his likes or dislikes. And in the second place, the evidence—at least, such of it as is most credible—is so conflicting that one cannot determine which breed as a whole, has the best record.

At the Pan American Exposition the Holsteins were winners for profit on total solids, but were 4th on butter. At the Wisconsin Experiment Station with full bloods and grades, 5 Holsteins with 11 yearly records gave an average profit per year for butter and skim milk of $48.41; the best 5 Jerseys in that herd with 8 yearly records, showed $52.58 annual profit; the best 5 Guernseys with 11 yearly records, $49.72.

Similar variations will appear as often as comparisons are instituted, and the only justifiable conclusions to be drawn from them are: (1) that individuality is more important than breed, and (2) that each man should select the breed which is most to his personal liking.

Orchard Grass for Roughage.

Kindly inform me through the columns of your paper if second cutting of Henderson's mixture (largely composed of orchard grass) would suffice for a coarse feed, when fed iu connection with the following concentrates: Wheat bran and middlings, gluten and cotton seed meal, and in what proportions should they be fed, where the above feeds are the only ones on the place. O. E. W.
Hyde Park, N. Y.

The "mixture" referred to is of too uncertain composition to warrant complete reliance upon the figures which follow, wherein we have assumed that the second cutting of this Henderson's mixture was equivalent to average orchard grass hay. But the totals arrived at in this way are sufficient to allow quite a margin for any variation that may appear in practical feeding. We feel quite certain the 8 lbs. of grain will be found quite ample as an average daily allowance, and even more than necessary, unless the average daily yield of milk runs above 25 lbs. per cow. And as for hay, the inflexible rule should be to place no more before any cow than she will eat up clean, and then if there is a tendency to put on too much body fat reduce the allowance of grain.

Subject to the reservations above indicated, we submit the following as an average daily allowance per cow:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients.		
		Protein.	Carbohydrates	Ether Extract
18 lbs. hay	16.22	.79	7.61	.25
4 lbs. bran	3.52	.50	1.54	.12
2 lbs. middlings	1.76	.26	1.06	.07
2 lbs. gluten meal	1.76	.64	.82	.05
Totals	23.26	2.19	11 03	.49

To Avoid Laying on Fat.

Please tell me what and how much to feed a heifer nine months old to avoid laying on fat. Have one that calves next month, that I have made fat enough to butcher.

When drying a cow how much bran should she have while dry, and how much flax seed meal to keep her bowels free? (MRS.) A. F. W.
Los Angeles, Cal.

There is not much to be said about what to feed, except that as a whole the ration should incline to feeds carrying a goodly proportion of protein, as this is the element which is chiefly concerned in the growth of muscle, ligaments, hair, horns and bone. Alfalfa hay, common clover hay, oats, bran and similar feeds are better than such carbonaceous feeds as timothy hay, corn stover and corn. But animals may fatten on protein food stuffs if fed to excess. The remedy is to feed less or give more exercise.

The amount of bran, if any, to feed to dry cows will depend npon the kind and quality of forage. With alfalfa hay, we should prefer barley to bran, but with timothy hay, bran would be better than barley, and in either case the amount to be fed will depend upon circumstances. Feed enough to keep the cow in a good thrifty condition. And so with the flaxseed meal, feed more or less, or none at all, as circumstances may seem to require from day to day,

We were very much impressed with what Mr. VanNorman said about the conduct of the dairy herd at Wauwinet Farm. "We have no rules," he said, "only maxims." Instead of prescribing a definite rule for feeding, apply the maxim: "Feed each cow so much, and only so much, as she will make profitable use of."

Separator vs. Raised Cream.

I have a separator on trial with a man who uses a setting can in cold water. Can is 9 inches deep and 16 inches across, faucet in bottom to draw off milk He divides the milk each time, taking ½ of it in the setting can and the other ½ in the centifrugal separator. Cream will raise on skim milk from the can, but none will raise after the centrifugal separator. He admits this, but still claims to make more butter from the can. Won't cream raise if any is left in milk from centrifugal separator? Do you think this possible, unless he in some way, perhaps ignorantly, works to increase the butter yield from the can. J. W. L.
Webster City, Iowa.

A separator will remove all but a few tenths of a per cent of the fat in the milk; practically it recovers all of the fat. The can method of creaming always leaves a large per cent of fat in the milk and unless ice is used as in the Cooley system, one per cent of fat in the skim milk is not uncommon. A separator will always find cream in the skim milk set without ice, but no cream will rise on separator skim milk if the machine is run properly. It is possible that the patron may make more butter from his can cream than from separator cream, because he understands handling can cream, but not the other variety, but a good butter maker would always obtain more butter from the separator cream when the milk is divided as above stated.

A Wisconsin Feeding Inquiry.

I am just starting to try and farm. Have bought 4 cows, which are giving now from 15 to 20 pounds of milk a day. What would you advise me to feed these cows of the following feeds: Oats at 34c per bushel, shorts at $1.10 per hundred, bran at 90c and oil meal at $1.60. Have nothing but mixed hay and some oat straw for roughage. G. G. P.
Prairie Farm, Wis.

At the prices named, bran is cheaper than oats, and more especially if one must pay for grinding the oats. We should rely therefore largely on bran, although a few oats—2 lbs. a day perhaps—and a little oil meal would probably be so advantageous as to more than pay for their cost. We should consider 4 lbs. bran, 2 lbs. oats and 1 lb. oil meal, with hay and straw at will, a maximum allowance.

Mr. Wheaton's Canadian Dairy Notes.

Canadian Dairy Laws and Government Assistance—Canadian Dairy Products in Japan—Shipping Butter and Eggs—Oleo and Renovated Butter Prohibited in Canada.

ED. HOARD'S DAIRYMAN:—Canadian dairying has had much to thank the various governments, both Dominion and Provincial, for. In the early days, when our dairying methods were taking definite shape, wholesome laws were enacted, which made it practically impossible for spurious goods, or dishonest products, to be manufactured in Canada. These laws have wrought lasting good, from which the dairyman of to-day is reaping a rich reward.

But this was not all. In those early days, through the generosity of the local government, educational methods were initiated, which have proven most effective in improving the quality of the dairy products of Ontario. Later the Quebec government followed in her footsteps, and inaugurated a system of syndicate instruction that has been demonstrated as an almost ideal one for securing a uniformity of product. Ontario is now copying some of Quebec's methods with most beneficial results. To a more or less extent, the other provinces are now taking up the same line of work, to the lasting good of the dairy industry. With the advent of Prof. Robertson at Ottawa some dozen years ago, came the inauguration of the Dominion dairying service, and dairy education and instruction took on a new and broader meaning.

This service began reaching out into the outlying districts. Prince Edward Island came under its sway, and as if by magic, cheese factories sprung up in every neighborhood, the "cow" became a greater benefactor of the farmer, and the little Island "down by the sea" began life anew. The Island farmer had a new source of wealth which he has continued to make the very most of ever since.

But the good work did not stop "down by the sea." New Brunswick and Nova Scotia felt its touch. It was extended westward into the prairie land. Manitoba came under its influence, and was benefitted. The territories tasted of its sweets, and the Pacific coast, over 3,000 miles distant from the Island province, was in no way neglected. Thus, from ocean to ocean, the principles of good dairying have been advocated, and the people aided in their efforts to produce only dairy products of the highest quality.

After these years of labor and effort the Dominion service is now concentrating its energies mainly, in so far as practical educational effort is concerned, on the northwest territories. Here it is opening up the way for the pioneer and providing him with a means of greatly adding to his revenue while laying the foundations of a home in his adopted country. The work is progressing quietly but effectively, and the creameries of the far west have no reason to be ashamed of the quality and quantity of the product they are turning out.

At the present time there are eighteen creameries in the territories under the direct control of the Dairy Division at Ottawa. Last year, five carloads of butter from them were exported to Great Britain, one carload was sold for export to Australia, and shipments were also made to China, Japan and the Yukon, the balance of the year's output being disposed of in the local markets and in the mining centers of British Columbia.

The year 1903 has witnessed a large expansion in the output of these creameries. Up to Oct. 1st last, the output of butter from the government creameries in the northwest exceeded that of last

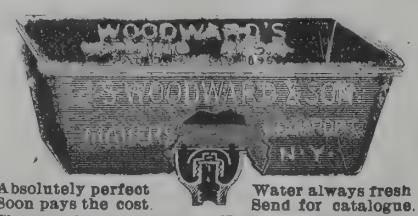
ARE YOUR KIDNEYS WEAK?

Thousands of Women Have Kidney Trouble and Never Suspect It.

MRS. SCOTT

An interesting letter to our readers from Mrs. Gertrude Warner Scott, of Vinton, Iowa.

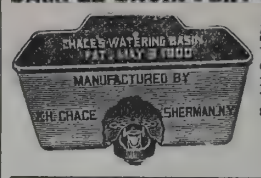
Vinton, Iowa, July 15th, 1902.



In the summer of 1893, I was taken violently ill. My trouble began with pain in my stomach, so severe that it seemed as if knives were cutting me. I was treated by two of the best physicians in the county, and consulted another. *None of them suspected that the cause of my trouble was kidney disease.* They all told me that I had cancer of the stomach, and would die. I grew so weak that I could not walk any more than a child a month old, and I only weighed sixty pounds. One day my brother saw in a paper an advertisement of Dr. Kilmer's Swamp-Root, the great kidney, liver and bladder remedy. He bought me a bottle at our drug store and I took it. My family could see a change in me for the better, so they obtained more, and I continued the use of Swamp-Root regularly. I was so weak and run down that it took considerable to build me up again. I am now well, thanks to Dr. Kilmer's Swamp-Root, and weigh 148 pounds, and am keeping house for my husband and brother, on a farm. Swamp-Root cured me after the doctors had failed to do me a particle of good.

Gratefully yours,
Gertrude Warner Scott

The mild and prompt effect of Dr. Kilmer's Swamp-Root, the great kidney, liver and bladder remedy, is soon realized. It stands the highest for its wonderful cures of the most distressing cases. Recommended and taken by physicians, used in hospitals and endorsed by people of prominence everywhere. To prove what Swamp-Root will do for you a sample bottle will be sent absolutely free, by mail, also a book telling all about Swamp-Root and its wonderful cures. Address Dr. Kilmer & Co., Binghamton, N. Y., and be sure to mention reading this generous offer in the Fort Atkinson HOARD'S DAIRYMAN.



If you are already convinced that Swamp-Root is what you need, you can purchase the regular fifty-cent and one-dollor size bottles at the drug stores everywhere. Don't make any mistake, but remember the name, Swamp-Root, Dr. Kilmer's Swamp-Root, and the address, Binghamton, N. Y., on every bottle.

"1900" BALL BEARING WASHER sent free, without advance payment, freight prepaid both ways on 30 days trial. Mr. Geo. N. Burnet, Ashtabula, O., says, "Have done 1200 washings and is good for 1200 more. Beats them all, and have tried 8 different machines. Write at once to "1900" Washer Co., 219 A State St., Binghamton, N. Y

Absolutely perfect Water always fresh
Soon pays the cost. Send for catalogue.

Buy You a Ticket to CROOKSTON, MINN., and call upon

The Polk County Land & Loan Company

For Choice Red River Valley Farms. They pay railroad expenses if you buy from them. A few good bargains.

360 acre farm, 4½ miles from Crookston, Minn., a city of 7,000 inhabitants, and 2½ miles from the State Experimental Farm. This is a photograph of the buildings as they are today: House is 16x24 1½ stories with an L 14x22, and a wood shed in connection 20 feet square, all on a brick foundation. Barn 28x48, with a lean to 16x48, sheeted both inside and out. Two granaries, one 14x20, and the other 14x42. The buildings are all well painted and in very good repair, and has a fine artesian well. Every acre or this farm is under a high state of cultivation, and is well drained by a slight ravine running through the farm merely sufficient for self drainage. The soil is a rich, deep black loam with a clay sub-soil, and in every respect is considered to be one of the best farms in that vicinity. Our price on this farm is $35.00 per acre.

This is a **320** acre farm about 2½ miles south of the city, this farm is quite well improved, has a very good house of about seven rooms, 1½ stories, barn large enough for ten head of horses, also a good granary, pasture and an artesian well, also has a good well at the house, good grove around the building. This is a very choice piece of land for the price $32.50.

160 acres north-east of the city; this is all hay land, and located in a German settlement, the surrounding country is nearly all under cultivation; we consider this a good piece of land for an investment, this could all be put under the plow, if desired. Price $19.00 per acrs.

YOU CAN....

BUY A FARM

ON PAYMENTS

So easy that you will regret it if you do not investigate. Our lands are

CHOICE HARDWOOD LANDS.

Especially selected with a view to quality, location and natural advantages. Put your savings into land that will double in value inside of a year. Ask us for the facts about them. A postal card with your address will do. Lands are now selling at $10.00 per acre. $400 in easy payments will buy 40 acres.

INTERIOR LAND CO., Janesville, Wis.

We Bring Buyer and Seller Together

Do you wish to sell or exchange your farm, reamery or cheese factory? No matter where o cated—east, west, north, or south. Write for our new plan. We put you in direct communication with buyer. Save the big commission which agents would charge.
HILES & MYERS, C-100 MATTHEWS BLDG., MILWAUKEE, WIS.

Do You Want Ten Cows?

WE make the following liberal offer to any reliable farmer who buys 160 acres of land of us: We will furnish you with 10 cows, either fresh or soon to become fresh. They cost you just the market price. You sell their cream to the creamery. Every month you have the Creamery Company send us sixty per cent. of the amount due you for cream. You do this until the cows are paid for. In one year the cows with their increase will pay for themselves. After the first year they will take care of the annual payments of principal and interest due on your farm. If you buy a half section, we will furnish you with 20 cows, and so on, selling you 10 cows for every 160 acres you buy. This is the "crop payment plan" applied to stock. We expect purchasers to pay from $2.00 to $3.00 per acre in cash—sometimes we make easier terms to good men. If our plan interests you, write us.

WHITNEY & WHEELOCK,
25 Broadway - - FARGO, NORTH DAKOTA

Modern Merchandising

Have you ever stopped to think about the question of getting your household supplies to the best advantage? Are you perfectly satisfied with the way things are running—with the prices you pay, the quality of the goods, the range of selection and the general question of making both ends meet? Perhaps you buy your supplies from the cross-roads store, just because your grandfather did. Perhaps you are tied up to the general store because you can trade in your butter and eggs at a low price and take it out in trade at a high price. Possibly you have never thought about it one way or the other. It is time to think. You have got to live and support your family. Your income is limited to so many dollars per year, and you have got to figure out the expense account so that things will come out right at the end of the year. If you can make both ends meet nicely and lay aside a tidy sum for a rainy day, you are only doing what every head of a family should endeavor to do, and if you don't do it you are simply inviting misery for the next time the crop fails. If a dollar looks as big to you as we think it does, we want you to think over this question of modern merchandising and see just what it means. It means different things to different people. To some it means buying everything on credit, then mortgaging the farm when settlement day comes around. Others think cheap goods the pathway to economy—the cheap, worthless trash that is advertised so brazenly at "the lowest price on earth." Many people send off to the city and get a jack knife at a 25 cents saving, and then fall back into the old rut in buying the balance of their supplies. Our idea of modern merchandising is to supply all your wants—everything you eat, wear or use—for yourself, your family and the hired man, at an average saving of 15 to 40 per cent, which means that if your yearly purchases amount to $200, you can save something like $50; or $100 if it costs you $400 a year to live. Are you so well off that $100, or even $50 does not interest you? Then again, consider the advantages. Absolutely reliable merchandise of the very best quality, and an unlimited range of selection. New goods. Prompt service. Prices that spell economy, and the certain knowledge that absolute satisfaction is the keynote to every transaction. To make trading with us possible, we issue a catalogue of 1128 pages, in which almost everything imaginable, including Vehicles and Farm Implements, is illustrated, described and priced. This catalogue can be absolutely depended upon and enables you to select your entire bill of merchandise without hurry or confusion and with the certainty that everything will be found exactly as described or you need not keep it. We ask you to get out of your present rut and give our methods a trial. We satisfy others and will satisfy you. There never was a better time than right now to begin, for we have just issued a new catalogue full of the things you will need to see you through this winter, and you can make no better investment than to fill out this coupon and send it to us now while the subject is in your mind. We ask 15 cents, merely as an evidence of good faith on your part. If you will risk 15 cents, we will risk sending you a catalogue that costs us over half a dollar to print and is so big that it requires 26 cents postage. It is our 76 cents against your 15 cents. Will you do it? Write today.

Laying in Supplies: Living from hand to mouth is one way of living, but why not get your supplies on a wholesale basis and avoid the petty annoyances of retail buying, to say nothing of making four dollars go as far as five dollars used to. That's the grocery list you see hanging on the wall. Supplied with loops to hang up with. A postal will bring it. Nothing like groceries for a foundation for a 100-lb. freight shipment.

Montgomery Ward & Co.

Michigan Avenue, Madison and Washington Streets, Chicago

year by 100,000 pounds. This increase has been mainly in Alberta. This year no butter has been exported to Great Britain. What has not been taken by the local markets in the west has been exported to the Orient.

At the great Japanese Exposition at Osaka, the Government of Canada made an exhibit of dairy products. It has already proven an excellent advertisement and borne good fruit. The Department has secured three customers in that country as a direct result of Canada's display at Osaka.

The trade in butter for the Orient is for the European residents there and not for the natives, though the latter may acquire a taste for our butter later, which may lead to largely increased trade. Mr. J. A. Ruddick, Chief of the Dairy Division, is in hopes of developing a large trade with the warships touching at some of the Japanese ports for coal. These warships sometimes stay several weeks at these coaling stations, and in that time it might be possible to get a supply of fresh butter to them from Canada. This trade can, perhaps, be handled better by the Government than by private enterprise, especially at the beginning. The Government has better facilities for studying the market, and financing the business and can ship at once on receipt of a cablegram. After the trade has been established and permanent connections made, there is no reason why private enterprise could not conduct a satisfactory trade with the far east.

During the summer months, part of the butter for the east went forward in tins, but a considerable quantity has also been sent forward in boxes. These boxes have been of assorted sizes, and the butter in them has stood the journey very well and has been reported in very good condition on arrival. For the Yukon trade, which is also increasing, shipments have also been made in boxes with good results.

As a side line, to aid the farmers in disposing of their produce, the government has adopted the plan of egg collecting in connection with the creameries. The eggs, when collected are placed in cold storage, where they are held until marketed. The plan, when started a year or two ago, worked well and has improved ever since, the eggs collected this year being better than ever before.

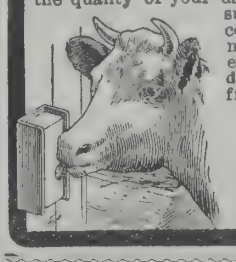
It is worked out in this way: Each creamery patron has a number which he is required to mark in pencil on all the eggs he supplies. The eggs are collected by the driver who gathers the cream, and kept at the creamery for a short time, when they are sent in refrigerator cars with the butter to the cold storage at Calgary. There all the eggs are examined and classified by an expert, and every farmer is credited with the exact number of each class of eggs he has sent.

The Department advances fifteen cents a dozen on the eggs at the time they are received and later the farmer gets the balance according to the classification. This year the average price will be about twenty cents per dozen for the season, or about twice what they could be sold for locally. Last year 21,000 dozen were handled, and this year the number will be about 30,000 dozen.

People living near large centres of population where fresh eggs are at a premium most seasons of the year, can hardly realize the benefit this little side line which the Dairy Division is carrying on, is to the scattered farming population of the west. A similar plan might well be adopted in connection with many of the creameries in the more thickly settled districts.

One of the important pieces of legislature enacted by the House of Commons at Ottawa, during the session closed on Saturday last, was an act prohibiting the importation, manufacture or sale of adulterated, process or renovated butter, oleomargarine, butterine or other substitute for butter, and to prevent the improper marking of butter.

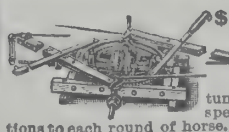
By this act a "creamery" means a place where the milk or cream of not less than fifty cows is manufactured into butter, and "dairy" means a place where less than the milk or cream of fifty cows is so manufactured. This defines the terms "creamery butter" and "dairy butter" and prevents the private dairyman unless he has fifty or more cows, from marking his butter as "creamery" if it is intended for export. An exception is made where the butter is sold locally, providing that the butter is in rolls, prints or packages of less than 25 pounds in weight.



Many creamery men were anxious to prevent the marking of dairy butter as "creamery" both for the local as well as for the export trade. If this were done, it was thought that it would work a hardship upon many a private dairyman, who is making a quality equal to that of the creamery made article, and consequently the exception was made in the case of butter sold locally. J. W. WHEATON.

Toronto.

THE term "narrow ration," used by the scientific agricultural writers in government farm publications, does not perhaps convey its true meaning. A narrow ration might suggest the idea of a poor ration, which is not the case. It means a feed comparatively rich in protein (nitrogenous compounds) which supplies muscle, bone and sinew. It is contradistinguished from wide ration which is a feed composed largely of starch and fats.



Compressed Pure-Salt Bricks.

The Distribution of Skim Milk.

It is known that the just complaints of creamery patrons on account of unfair distribution of skim milk are the bane of the separator creamery business. Further disputes among patrons, annoyances to managers, hindrances to the best work of buttermakers, watering the skim milk, and many other ills in the same train are unnecessary, since the

Barber-Coleman Check Pump

has for more than five years been successfully solving the problem in many different creameries. When a patron has dropped in his check he can pump the amount of skim milk called for by his check, less the percentage taken out as cream, so in like proportion to all other checks. Its measuring apparatus is just an ordinary pump which everyone understands and knows how to operate.

Suggestions for a Southern Barn Wanted.

ED. HOARD'S DAIRYMAN;—Please give me plan for a southern barn to accommodate three horses, three cows and four or five wagons, with feed room and harness rack and hay loft; this stable to be as cheap as practicable and healthy.

Scranton, Miss. A. L. D.

It will require a good sized barn to provide conveniently for this number of animals and vehicles. It would be cheaper, but probably less convenient and attractive, to provide for the wagons in an independent shed, about 35 feet long and 16 feet wide.

The diagram we submit calls for a structure 40 feet long by 30 feet wide, and, as will be seen, provides for the horses and cows and the free storage of four vehicles. By just a little crowding another wagon or carriage could be accommodated. The "clear space" between the horses and wagons, and directly in front of the entrance will be found very convenient for hitching teams to wagons and unhitching, especially in stormy weather, or where artificial light is required.

The opening for taking hay into the loft should be about midway of the side where horse stalls are located so that the last taken in will be the first to be taken out for feeding. The space between the last horse stall and stairs can be used in emergency for a fourth stall, or, if convenience requires, the place there marked for a window can be utilized for a door.

We suggest two ventilating flues, one in either end, and opening into the cow stable at one end and just over the entrance at the other end. For the climate of Mississippi, we do not think it important that these flues should extend to the lower floor.

NOTE—By an oversight in lettering the diagram the width of the stalls for horse is incorrectly given, They should be 4 ft, 6 in. wide.

Good Reasons for Reading the Dairyman.

An Oregon Subscriber's Views—Bran and Damaged Wheat—Roots—Profits from Three Cows.

ED. HOARD'S DAIRYMAN:—Enclosed you will find a dollar for renewal of my subscription, for I find your paper worth it, not alone because it contains so much that is new and original, but because it calls to one's mind things that have been forgotten, and stirs up one's thoughts and in it one finds out what his neighbors are doing, and one feels like doing a little better than they.

Last winter we had 3 cows and we had milk and cream for a family of seven and our creamery check was from $20 to $23 per month and the skimmed milk was worth enough to make $25 per month. During late summer our pasture was short and butter fat lower and the income went down to $9.

This winter we hope to have 6 cows. Have 3 tons of carrots, and chopped wheat which cost, $1.05 per hundred. It is wheat that is slightly shrivelled and was cut with binder and got wet in shock, but do not think it is damaged any for feeding purposes. Bran is $18 per ton. Would like to have your opinion as to the feeding value of the wheat and bran at those prices; also as to value of roots as compared to silage, where one has but few cows and little means. I find that the man behind the cows tells as much, as the quality of the cow; also good feed and lots of it. With me, winter dairying pays far best because cows are fresh and give a large flow, and then when grass comes they freshen up again and thus nearly double the profit by getting largest amount of milk when prices are best. L. B. Z.

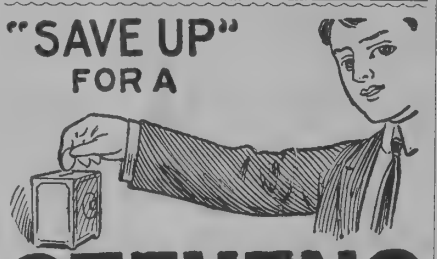
Milton, Ore.

We congratulate L. B. Z. upon the success he met with from three cows, and quite agree with him that the man behind the cows is not a negligible factor in profitable dairy farming. But the best of men cannot make much of a success with poor cows.

We can hardly agree with him that his unmerchantable wheat is not damaged for feeding purposes. How much the damage will amount to is entirely problematical, and whether it is worth $3 a ton more than bran can only be ascertained by actual trial. Probably a combination of the two feeds, equal parts by weight, and about 8 lbs., per day of the mixture, will be as good a basis to start from as could be suggested.

The 3 tons of carrots (6,000 lbs.) will be at the rate of 1,000 lbs. per cow, and should be fed so as to make them last as long as possible, probably about 8 lbs. per day to each. We do not consider roots of any kind anywhere near as valuable, pound for pound, as good corn or clover silage, but where one has less than 10 or 15 cows, it is doubtful if a silo would be profitable. In such cases roots make a very desirable addition to the ration.

CONCERNING OUR ADVERTISERS.



The following interesting facts concerning the Oakland Herd of Holstein-Friesian cattle at Weedsport, N. Y., has been received: It may interest you to know that at the recent fall fairs our herd of Holsteins was awarded the "Herd Prize" at New York, Indiana, Kentucky and Illinois State Fairs. At the latter place we defeated the champion western herd. At New York there were six herds competing. Many of our prize winners were sired by our bull Soldene Clothilde Artis. For instance, at Syracuse, N. Y., in the yearling heifer class there were ten entries. We were awarded 1st and 3d prizes. In heifers under one year there were twelve entries. We were awarded 1st and 2d. All four were sired by Soldene Clothilde Artis. This is evidence that we are breeding good individuals. But how about the butter capacity of our herd? For some time we have been using a son of Paul De Kol, whose dam, Mutual Friend 3d, made an offical butter record of over 21 lbs. at three years, and over 22 lbs. at 4 years, 80 per cent fat, and the average test of her milk for both years was 4.27 per cent. To further strengthen our herd in the line of rich milk, we have purchased the young bull Canary's Mercedes' Son. We believe he has a larger inheritance of rich milk than any other animal of the breed; his dam has an official record of over 25 lbs. of butter in 7 days, her milk averaging 4.92 per cent fat. The average per cent of fat of herself, five daughters 4.11, six granddaughters and two great-granddaughters, all in official tests, is over 4 per cent. The average per cent of fat of her four sisters is 4.08.

DIAMOND.

ed upon their season's advertising in our columns. This concern is fortunate in the possession of two of the best of the cheaper roofings on the market and we hardly need mention their names to tell our readers what they are. Their Neponset Red Rope roofing is the cheaper of the two, and is specially adapted to roofing and siding of poultry houses, outbuildings, sheds, etc. While it is not claimed to be a permanent roofing, yet many are the instances where it is in good condition after having done duty ten or twelve years. This quality, together with the ease of laying it and the exceedingly low price at which it is sold, have made it a familiar sight in all parts of the country. The Paroid roofing is of a highly permanent character. It is a fabric, not a paper; there's no tar in its composition, it never gets brittle or cracks, and it is noted for its smooth, flat laying and great length of service to be obtained from it. Its qualities adapt it to the use for more pretentious buildings, as barns, and even fine residences. For such service the price is exceedingly low, though sold, of course, at a higher price than the Neponset. Both roofings are alike in this, that a complete roofing kit accompanys each roll and anybody can lay them. Building Economy, a booklet about low priced roofings, distributed by the manufacturers, is well worth reaning. It is mailed free.

Our Special Elgin Letter.

ED. HOARD'S DAIRYMAN:—The official market was reported firm at 22 cents.

Former markcts:

Oct, 26, 1903, 295 lbs. at 21½ cents.

MANITOWOC, Wis., Oct. 28—Cheese—Sales 90 boxes Twins, 10c; 850 Young Americas, 10¼c; 1,600 Daisies, 10¼c.

SHEBOYGAN FALLS, Wis., Oct. 28—Cheese—21 factories offered 1,653 boxes of cheese on the call board today and all sold as follows: 17 Twins 10¼c; 168 cases Young Americas 10⅞c; 322, 10¾c; 13, 10⅝c; 145 Daisies, 10⅞c; 116, 10¾c; 652 cases Longhorns at 10⅝c, 220, 10⅝c. Market steady.

SHEBOYGAN, Wis., Oct .28—Cheese—There was a decrease in the offerings and prices of cheese on to-day's call board. The offerings comprised 1,648 boxes, which, with the exception of 50 cases of Young Americas sold as follows: 395 Daisies, 10⅞c; 451, 10¾c; 45, 10⅝c; 212 cases Young Americas, 10¾c; 24, 10⅝c; 363, 10¾c; 36, 10⅝c; 72, 10½c.

MUSCODA, Wis. Oct. 23—Cheese—The sales today were: 60 boxes of Daisies at 10¼c; 275 boxes of Twins were offered but were withdrawn; 9¾c was bid on the Twins.

PLYMOUTH, Wis., Oct. 28—Cheese—Thirty factories were represented and offered 2,730 boxes of cheese, all of which sold as follows: 429 Longhorns at 10⅞c; 80 at 10¾c; 1,243 Daisies at 10¾c; 353 Twins at 10¼c; 196 at 10½c; 429 Young Americas at 10¾c. Market active and firm.

MARSHFIELD, Wis., Oct. 23—Cheese—Eight factories offered 809 boxes of cheese but no sales were made. 9¾c was bid for Twins and 10½@10⅝c for Daisies. Cheese makers passed on about one-half the offerings, after which the buyers present withdrew their bids on the balance. A motion was then made and carried to adjourn subject to a call of the officers next spring.

FOND DU LAC, Wis., Nov. 2—Cheese—Sales of cheese on the Dairy Board today were 143 Twins ot 10¼c and 420 Daisies at 10½c. The market was quiet.

BRILLION, Wis., Oct 22—Cheese—Sales today were: 163 Twins at 10c; 650 Daisies at 10⅜c; 287 at 10¼c; 70 Cheddars at 10c.

Eggs—Receipts, 5,249 pkgs; strong; state and Pennsylvania; average fancy, 28c; state and Pennsylvania, seconds to firsts, 22@26c; western extras, 27c; western, thirds to seconds, 19@24c; western, firsts, 25@26c; refrigerated, 18@21½c.

NEW YORK MARKET.

NEW YORK, Oct. 31—Butter—Receipts for the week, 35,213 packages. Exports for the week, 100 packages.

The amount of fancy fresh creamery butter arriving was hardly enough to supply the trade and yet prices remain about the same as they were last week, and are slightly in buyer's favor at the close. This condition is accounted for by the fact that some of the receivers have been using out of their finest June freezer butter to fill best orders and this has more than made up for the shortage of extra goods. Strictly fresh butter, however, will have the preference and best retailers will continue taking extra fresh goods whatever the price.

Under grades of fresh Creamery have been in demand and sold up clean at 18 to 22c. No New York State Dairy arriving and our prices are nominal. Outside of the small retail trade for the extreme top quality of June Creamery, there was nothing doing, and freezers are about as full as they were on September 1st.

Ladle and Packing stock were more plentiful at lower prices. We quote:

Creamery, extra, 22½c; medium, 21@22c; poor, 16@20c. Dairy, extra, 21@22c; medium, 18@20c; poor, 14@17c.

Cheese—Receipts for the week, 31,536 boxes. Exports for the week, 5,701 boxes.

The market has ruled steady for fancy Full Creams, and best makes of light skimmed cheese and prices are same as last week. Under grades of Skimmed Cheese are only salable at low prices, say 2 to 4c. We quote:

Full cream, extra, 11¾c; medium, 11@11½c; poor, 9@10½c.

Eggs—Receipts for the week, 35,402 cases.

Finest marks of new laid eggs sold quick on arrival and are scarce and wanted at the close. The scarcity of fancy stock has created a good enquiry for refrigerator eggs and best marks are in demand at full prices. We quote:

New York & Pennsylvania, best, marks, per doz., 28@30c; Northern & Western, best, marks, 27@28c; all sections, poor to fine, 20@26c; refrigerator poor to fine, 18@22c.

BALTIMORE MARKET.

BALTIMORE, Oct. 22.—Butter—Since our last report there has been a further shrinkage in the general receipts of butter. The supply of extras, while rather light, is about equal to the demand. Firsts, for the time being, are in more liberal supply, owing to the fact that many lots that were shipped as extras would not grade over firsts; hence the increase. Imitation creamery of choice to fancy quality is in very light supply; there is a quick sale awaiting all arrivals of this kind. Ladles, when fresh and sweet, also meet ready sale, while defective stock is hard to move. Packing Stock—The receipts of the kind are about equal to the demand. Blocks and prints—All choice to fancy invoices meet quick sale, and in some few instances our top prices have been exceeded on extra fancy stock. The market generally closes quiet, but firm, and the advance of ½ cent over last week's prices on extra creamery have been well sustained.

Creamery separator, extras, 22½@23c; firsts, 20¼@21½c; seconds, 18@20c; imitation creamery, extras, 19@20c; firsts, 17@18c; seconds, 15@16c; Iowa & N. W. Ladle, extras, 16c; firsts, 15c; seconds, 13@14c; Ohio & Indiana Ladle, extras, 16c; firsts 15c; seconds, 13@14c; creamery blocks (2 lbs.), extras, 23½c; firsts, 21½@22½c; seconds, 20@21c; creamery prints, (½ lbs.), extra, 24½c; first, 22½@23c; seconds, 20@21c; Md. Va. & Penna. prints, extras, 23c; firsts, 20@22c; seconds, 17@19c.

Eggs—Since our last report there has been quite a falling off in the receipts, while the demand has been quite good; hence our market has been kept quite bare of all desirable stock, and closes firm at 28 cents on attractive offerings of either fresh or storage eggs.

Excursion tickets at greatly reduced rates are on sale to the territory indicated above. Standard and Tourist Sleeping Cars, Free Reclining Chair Cars and "The Best of Everything." For dates of sale and full particulars apply to agents Chicago & North-Western Ry. 53-sp

Dairy Bulls.

[Paper read by CHARLES L. HILL, Rosendale, Wis., at the Wisconsin Dairymen's Association.]

"How can I be reasonable sure, that any bull, that you, or any other breeder, may send me, will improve the quality of my herd,"

This question I copy from a letter, received in my mail two weeks ago.

This is with all of us the leading question, and I wish I were able to answer it with any degree of certainty.

In our few minutes talk together we may be able to exchange some ideas that will be mutually helpful.

In the discussion of this question, the first thing to do is to answer the question, "who needs a dairy bull?" and I would answer it by saying, that any man who intends to make dairying the chief aim of his live stock farming, needs a pure bred dairy bull.

"What breed," you ask. I would answer, just the breed you take a fancy to, for with this one, you will have the best success, because you will give it the best care.

The bull the dairyman will need, will possibly not be the one that the pure breeder will need, for the latter, besides utility, is seeking for good looks and many fancy points.

The essential points will be the same however.

In his search for a bull, by correspondence, the dairyman must rely largely on pedigree, and the reliability of the breeder he deals with.

If possible, I would go and see the dam of the bull I was to use in my herd.

"How good a cow shall she be?" I would say that with the improved methods of care, given by the breeders of today, to their herds, no bull should be given a place in a good dairyman's herd whose dam will not make at least 400 pounds of butter in a year, or its equivalent, 343 pounds of fat.

The greater her record, the more valuable her son, other things being equal.

An excellent plan is to buy an old bull, if still vigorous, and only in this way can you know just what kind of a sire you may have.

Many of the best sires of all the breeds have gone to the shambles long before their usefulness was known.

In the selection of a bull for his individuality, the first thing I would want would be masculinity.

This is not shown by his being coarse, or having a big head, but by his resolute, sturdy, commanding appearance.

This has nothing to do with his being cross, for this is largely education, or rather the lack of it.

He wants to show that he has energy to spare. Then I want him to have a good muzzle, showing good appetite; and then a large barrel, showing good digestive capacity.

For use in a grade herd, never mind if his great barrel has caused his back to sag a little.

Nearly the same words will apply to the selection of a young bull.

Let him be active, robust, intelligent looking and showing large capacity.

If you wish his daughters to have good shaped udders and good sized teats, see that his dam has such an udder and that the bull himself has good sized, squarely placed, rudimentary teats.

Let him be thin in the thighs and show no tendency to beefiness at any place. In fact let him be all that is different from a beef sire.

As emphasizing the thought that your bull should have a good mother, a few moments' study of some of the great dairy sires, of the different breeds will be pertinent.

The two bulls that lead the Holstein breed in the number of officially tested daughters are DeKol 2nds Paul DeKol and Aaltje Salo 3rd's Tritomia Netherland.

The first named was owned by Mr. H. D. Roe, Augusta, N. J., and he has about 45 registered daughters, and 31 of them have made tests that have placed them in the Advanced Registry. Two of them have made officially 29.26 lbs. and 28.24 lbs. butter, 80 per cent fat, in seven days at 4 years old.

This bull had for a dam DeKol 2nd, with a record of 26 lbs., 9.2 oz. of 80 per cent butter in seven days, and she was also the dam of three other bulls having together 26 Advanced Registry daughters.

Mr. Roe writes as follows concerning him: "The last three years that we owned this bull, on account of his being cross, it was necessary to keep him partly blindfolded and rather thin in flesh in order to handle him safely.

"He was fed ensilage once per day, hay twice. His grain feed was largely bran with some malt sprouts and dried grains.

"We never fed him any corn outside of what he got in the silage.

"At that time we did not have any way to exercise our bulls.

"We now use a tread power and would not think of doing without it.

The latter bull was owned by S. B. Jones & Son, Hustisford, Wis.

This bull has 38 registered daughters, and 32 of these have made records admitting them to the Advanced Registry.

This bull was bred in Wisconsin also, but I have thus far been able to find out but little about his dam.

His sire was a son of the well-known cow, Tritomia, that we have often heard Mr. Hoard tell of as winning 1st in the show ring and butter test as well, at the Minnesota State Fair.

This bull was fed 6 to 8 pounds per day of a ration of bran and oatmeal, and exercised in a yard one or two hours each day.

His picture, though a small one, shows him to have been of a very marked dairy type for the breed.

The bull of the Jersey breed that leads all others in the number of tested daughters is Exile of St. Lambert.

Ninety-four of these have made records of over 14 pounds butter per week.

He is said to have been a bull of great vigor and vitality, and retained his vigor up to the very day he died, at 13 years of age.

This bull had for a dam Allie of St. Lambert, with a record of 26 lbs., 12 oz. butter in seven days, and full sister to Ida of St. Lambert with a test of over 30 lbs. per week.

This bull was exercised in the following manner: A good strong post was firmly fixed in the ground and stayed on four sides.

Across this a strong pole of hickory, about 12 feet long was attached by means of a swivel. Exile was secured to one end of it by a chain from his nose to the pole, which was weighted down at the other end to balance it. He took his exercise in a circle.

The only picture of this bull available is a wood cut from a drawing.

As prepotent a Jersey bull as there ever was is still alive in King of St. Lambert's King, owned by Mr. F. W. Hart, of Cleveland, Ohio.

He was by King of St. Lambert, the sire of 26 tested cows, and out of his own daughter, Elsie Bonner, 21 lbs. butter in 7 days.

I never enjoyed a day much more than one spent in looking over Mr. Hart's herd, and especially looking at his bull, his mother and daughters, and last but not least a

"ADVERTISEMENT."

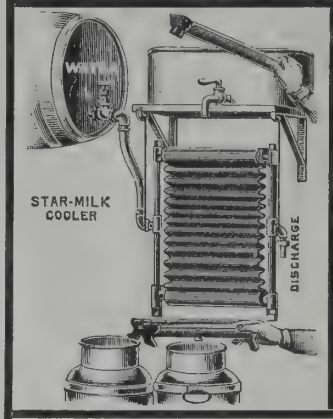
LIKED HIS "NIP."

Not a Whiskey but a Coffee Toper.

Give coffee half a chance and with some people it sets its grip hard and fast. "Up to a couple of years ago" says a business man of Brooklyn, N. Y. "I was as constant a coffee drinker as it was possible to be, indeed, my craving for coffee was equal to that of a drunkard for his regular "nip" and the effect of the coffee drug upon my system was indeed deplorable.

"My skin lacked its natural color, my features were pinched and my nerves were shattered to such an extent as to render me very irritable. I also suffered from palpitation of the heart.

"It was while in this condition I read an article about Postum Food Coffee and concluded to try it. It was not long before Postum had entirely destroyed my raging passion for coffee and in a short time I had entirely given up coffee for delicious Postum.



"The change that followed was so extraordinary I am unable to describe it. Suffice it to say however that all my troubles have disappeared. I am my original happy self again and on the whole the soothing and pleasant effects produced by my cup of Postum make me feel as though I have been 'landed at another station.

"Not long ago I converted one of my friends to Postum and he is now as loud in its praise as I am." Name furnished by Postum Co., Battle Creek, Mich.

Look in each package for a copy of the the famous little book, "The Road to Wellville."

"Money Makers for Butter Makers"

Even though it were not apparent that

COLONIAL BUTTER SALT

AND

LIBERTY BUTTER SALT

are superior to all other kinds in flavor, color and purity, there would always be apparent the fact that they are superior in lightness, bulk for bulk. Take the barrel that holds 320 lbs. of the other man's salt; it will hold but 225 lbs. of Colonial Butter Salt. The usual salt barrel has a 30 inch stave and a 19 or 20 inch head. The Colonial barrel has a 34 inch stave and a 21 inch head, to hold the same net weight of salt.

The lightness of the salt makes it dissolve quickly and evenly and prevents washing out in the working, and if there is any value in the "make weight" theory, this salt stands at the head in that respect.

THE FLAVOR IS PERFECT
THE COLOR PERFECT WHITE

The purity over 99 per cent, hightest in the world. PROVE IT YOURSELF. To those who have never used Colonial Butter Salt (light, flaky grain) or Liberty Butter Salt (granulated) we shall be glad to deliver, free of charge, to creameries and cheese factories only, a 56 lb. sack of either or both, on request. We only ask, in return, that you report to us your actual success with our salt.

Won't you try it today.

COLONIAL SALT CO., AKRON, OHIO

CHICAGO OFFICE.....84 ADAMS ST.

young bull showing vigor to spare, sired by King of St. Lambert's King, and out of his own dam.

This bull is commonly called Hart's King, and he has 24 tested daughters, and Mr. Hart writes me that he has 40 of his daughters and every one of them, old enough, is capable of a record.

I have here a fairly good picture of him, and a good one of some of his daughters.

This bull is just 12 years old and is still in the pink of condition and vigor.

For exercise he is often taken out for a twenty-minute walk by the man who cares for him. He is kept tied in a corner of the cow stable in sight of the herd of cows.

Of the well known Guernsey bulls, Lily's Bonny Boy owned by Mr. N. K. Fairbank, Lake Geneva, has 41 registered daughters, and 13 of these at least have made 343 lbs. fat in a year, and Lilly Ella and Lilyta made, in official tests, 782 and 710 lbs. fat respectively.

This bull was out of Lily of Fernwood, 22 lbs. 11½ oz. butter in a week, and one of the best cows of the breed.

This bull received his exercise by daily work in a tread power to run a separator.

The Guernsey bull having the second highest number of tested daughters was also owned in Wisconsin, and was Benjamin 1931.

He had 25 registered daughters, and nine of them have records ranging from 349 to 508 lbs. fat in a year, and ten of them have weekly records ranging from 12.02 to 17.7 lbs. fat.

He was exercised twice daily in the tread power, and proved a good sire until he was nine years old.

He was never as vigorous as some bulls, due, I think, to poor care when he was about a year old.

His dam, Tricksey, was in 1888 first prize cow at the Wisconsin State Fair, and made 2 lbs. 7¾ oz. butter in one day.

Mr. S. C. Kent, who imported over 1,000 Guernseys, says she was the best cow he ever owned.

I have here a picture of Benjamin and some of his daughters.

I tried to obtain pictures of all of these bulls and their dams, but was unable to do so, and this serves to emphasize the fact that usually the great bulls are not known until they are dead.

You will note that where feed is mentioned these bulls were fed a liberal grain ration, and I think one of the serious mistakes often made is to make a bull live entirely on roughage when in heavy service.

Let them have all the good hay or corn fodder they want, but feed lightly of corn silage.

Feed a ration of bran or bran and ground oats of from 6 to 8 lbs. per day.

If a bull is quiet, and a paddock is handy, he will be much improved by being at pasture in summer until the flies get bad, but in nearly all cases it is better to keep him in the barn.

Above all things that a bull needs, and not nearly enough of them get, is plenty of exercise daily.

On many farms where the item of expenses is not counted, a man will walk and lead a bull for an hour or more daily, and while it is doubtless efficient, few of us wish to spend our time in this way.

By far the cheapest and best way to exercise a bull is a tread power, and we have so exercised our bulls for ten years.

Nearly all of them learn it readily, even if old, and it will do no harm to work them there an hour each day.

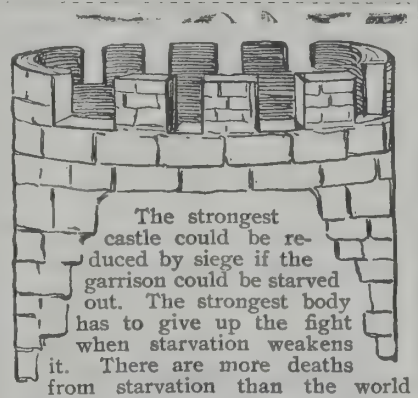
More than that, they can easily earn their board running the separator or other light machinery.

It will not do to have the power very steep for they will slip.

Another way to exercise a bull, is to work him in a harness, and I have photos showing bulls working single and double.

There are many other ways to exercise a bull; one is to tie him by a rope around his horns to an overhead wire or rope, 50 to 100 feet long.

(Continued next week.)



Farmers Must Be Ready.

Manufacturers of oleo are spending vast sums of money to evade the oleo law. Skilled chemists are busy hunting for a substance that can impart the accepted butter color to the manufactured article and yet keep within the bounds of law. Lawyers are seeking for weak technical points. No one is so verdant as to believe that the struggle will be given up without bitter fighting. Farmers everywhere must watch and fight for the preservation of the law secured, and see that infractions meet with a speedy and a just punishment. Be ready at any moment with voice and pen to guard well your interests.—*Farm and Fireside.*

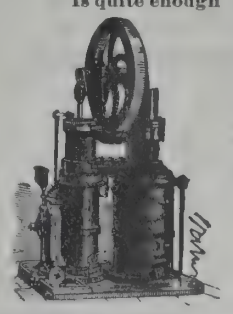
Some Things that Influence Butter Making.

A recent Indiana Station Bulletin on care of milk and butter making contains the following tabulation of causes and effects in churning that explains many of the mysterious and unpleasant conditions that often confront the home butter maker:

CAUSE.	EFFECT.
Gluten feeds, Oil meal, High temperature	Soft butter.
Cream of unequal ripeness, High temperature, Thin cream, Sweet cream	Large loss in butter milk.
Low temperature, Ripe cream, Evenly ripe, Rich cream	Small loss.
Low temperature, Very thin cream, Very thick cream, Sweet cream, Churn too full, Slow agitation, Cream of stripper cows, Cream of unequal ripeness	Slow churning.
Cream exposed to odors, Over ripe cream, Decaying feed, Moldy feed, Impure drinking water, Stable odors, Sick Cows	Impaired flavor.
Over ripe cream, Dried cream, Foreign matter	Specks in butter.
Uneven temperature, Uneven salting, Insufficient working, Sudden chilling, Change of temperature	Mottles and streaks.
Over working, Over heating, Over churning, Slipping of tools in working	Texture injured.
Thin cream, Sweet cream, Churn too full, Cold cream, Advanced period of lactation	Difficult churning.
Succulent feeds, Summer feeds	High colored butter.
Cotton seed meal	Light colored butter. Hard butter.
Bran	Hard butter.
Legumes	Hard butter.

The strongest castle could be reduced by siege if the garrison could be starved out. The strongest body has to give up the fight when starvation weakens it. There are more deaths from starvation than the world dreams of. When the stomach is diseased and the food eaten is not digested and assimilated, then the strength of the body begins to fail because of lack of nutrition, and the weak body falls an easy victim to the microbes of disease.

Dr. Pierce's Golden Medical Discovery cures diseases of the stomach and other organs of digestion and nutrition. It restores physical strength in the only possible way, by enabling the assimilation of the nutrition contained in food.



"I was sick for over three years with a complication of stomach troubles," writes Mr. John H. Castona, residing at 2942 Arch St., Chicago, Illinois. "Had tried every good physican I knew of, as well as many patent medicines, but received only temporary relief. One day a friend recommended your 'Golden Medical Discovery.' I immediately procured some and began its use. Commenced to gain the first week, and after I had taken only one bottle I could eat as well as any one without experiencing ill effects. I took five bottles, and to-day am happy to announce that I am as well and healthy as any one could be. I owe it all to Dr. Pierce's Golden Medical Discovery."

The sole motive for substitution is to permit the dealer to make the little more profit paid by the sale of less meritorious medicines. He gains. You lose. Therefore accept no substitute for "Golden Medical Discovery."

FREE. Dr. Pierce's Common Sense Medical Adviser is sent *free* on receipt of stamps to pay expense of mailing *only*. Send twenty-one one-cent stamps for the book in paper covers, or thirty-one stamps for the cloth-bound volume. Address Dr. R. V. Pierce, Buffalo, N. Y.

SOLE MANUFACTURERS

A Low Priced Octagon Silo.

ED. HOARD'S DAIRYMAN:—The first cost of a silo usually frightens the would-be builder from building, and the building thereof is postponed for another year. The writer saw the silo here shown, built by a farmer this week in a couple of days with no expert assistance—just built by the farmer and his ordinary help. The day before the erection of the silo began, the farmer had not a stick of the material on hand.

On the day mentioned, he brought a couple loads of logs to a nearby saw mill and had them sawn into 2x7 inch planks. In the same afternoon, he went to town and brought home a couple loads of hemlock boards and a roll of felt and some spikes and nails, and the next day began to erect his silo and in two more days the silo was completed ready to receive the silage corn.

We see no reason why this silo is not a perfect silo in every particular, and as good in every way as one costing several hundreds of dollars, and which would take weeks to erect. When a perfect silo can be built as cheaply and as quickly as was this one, we see no reason why anybody may not have silage if he wills.

This style of silo is the octagon shape, or eight sided, and ceiled perpendicular

with two thicknesses of inch hemlock boards with felt paper between. A silo, 12 feet in diameter and 24 feet high, will not cost more than $25, foundation included. Such a silo calls for 2,000 feet good hemlock boards, 900 feet 2x7's, with felt and nails. The expense of roof and foundation will be the same as for any other style of silo.

A low foundation of stone and cement is first built, then the sills are placed on and corners nailed. Then the boards are set up at the corners and plumbed with a level that works vertically. One man holds the joist on the outside where it belongs, placed 2 feet apart and nailed from the inside. The joists are spiked together at the corners as the work progresses, for the first 12 feet; then the upper section is continued in the same way.

A number of joists can be sawed with a cross cut saw, by bunching them together, thus ensuring even lengths. It will be seen that the joists and boards at the corners all have the same slant, or angle of 45°. This style of silo saves latching with iron hoops, or the tedious method of making wooden hoops for the round silo. Each range of octagons forms the hoops, and the octagon avoids corners, and has every advantage that the circle has.

The illustration shows the manner of cutting and forming an octagon joist, hoop, or

SPOTSWOOD GUERNSEYS

We offer some grand Imported Cows and Heifers, large and deep milkers and high testers; a fine lot of Heifers fit for service, and a few Imported Bulls from prize winners on both sides. Any animal in the herd for sale. Address WALTER JAUNCEY, Spotswood Farms Broad Axe P. O., Pa.

Wasteland Guernseys

Herd headed by Sir Coral, 5239 (son of Coralette, 560 lbs., grandson of Fantine 2d, 607.7 lbs.) and Glenwood's Sheet Anchor of Haddon, 6372, (son of Glenwood Girl 7th, 506.5 lbs., and grandson of Rutilla's daughter, 571.4 lbs.) Some elegant young bulls and bull calves for sale.
M. M. & E. J. HOLLINGSWORTH, Landenberg, Chester Co., Pa.

For Sample Copy of Jersey Bulletin address Indianapolis, Ind.

"IT'S UP TO YOU!"

sill and also a portion of the ceiling is shown. Four and one-half inch wire nails will answer for nailing the corners, having one-half inch for clinching, while three and one-half inch nails answer for nailon the ceiling. J. A. M.

P. E. I.

Weighing Cream for Testing.

ED. HOARD'S DAIRYMAN:—I was told by one of our patrons that it came out in HOARD'S DAIRYMAN that there was a $100 fine for using the tube that goes with the Babcock tester for taking samples of cream. If it was so stated by you, what and how done is a better and right way? I have said and still think so and shall until told by one that knows better, that with cream poured over three times and a sample taken at once with the tube is as near right as can be. N. T. A.

Uxbridge, Mass.

The "tube" referred to is evidently the 17.6 c. c. pipette used with the Babcock test. It was never intended that this pipette should be used for cream. It was designed especially for milk, and milk alone. Cream varies so much in physical quality, owing to varying amounts of fat, the presence of air, the physical condition of the casein that it is impossible to measure out 18 grams of cream, the proper amount for testing. On this account the cream should be weighed to obtain accurate results. The last Wisconsin legislature passed the following law to prevent such abuse of the Babcock test, when used for cream, which is sure to occur when the cream is measured.

SECTION 1. In the use of the Babcock test, the standard milk measures or pipettes shall have a capacity of 17.6 cubic centimeters, and the standard test tubes or bottles for milk shall have a capacity of 2 cubic centimeters for each ten per cent marked on the necks thereof; cream shall be tested by weight and the standard unit for testing shall be 18 grams, and it is hereby made a misdemeanor to use any other standards of milk or cream measure where milk or cream is purchased by or furnished to creameries or cheese factories and where the value of said milk or cream is determined by the per cent of butter fat contained in the same or wherever the value of milk or cream is determined by the per cent of butter fat contained in the same by the Babcock test.

SECTION 2. Any manufacturer, merchant, dealer or agent in this state who shall offer for sale or sell a milk pipette or measure, test tube or bottle which is not correctly marked or graduated as herein provided, shall be guilty of a misdemeanor, and upon conviction thereof shall be punished as provided in section 4 of this act.

SECTION 3. It shall be unlawful for the owner, manager, agent, or any employee of a cheese factory, creamery, or condensed milk factory to manipulate or under-read or over-read the Babcock test or any other contrivance used for determing the quality or value of milk or cream, or to make any false determination by said Babcock test or otherwise.

SECTION 4. Whoever shall violate any of the provisions of this act shall be guilty of a misdemeanor and upon conviction thereof shall be punished by fine of not less than twenty-five dollars nor more than one hundred dollars for each and every offense, and in default of payment thereof shall be imprisoned in the county jail not less than thirty days nor more than sixty days.

Show Us.

If the *National Stockman*, of Pittsburg, the *Dairy and Produce Review*, of San Francisco, HOARD'S DAIRYMAN, of Fort Atkinson, the *Country Gentleman*, of Albany, or any other publication or individual that has taken occasion to question the accuracy of published dairy tests, is in possession of information which will prove such fraud or inaccuracy, the duty of these papers or individuals is clear."

So says the *Jersey Bulletin*, meaning that they should furnish the proof of fraud. To the list of papers mentioned should be added the *New York Produce Review*, for in a recent issue, one of the editors of that journal, Mr. J. H. Monrad, commenting upon a statement in the *Jersey Bulletin*, advocating the abolition of the use of butter color, concludes by calling it "the misguided, one-sided *Jersey Bulletin*, the supposed Jersey breeders' friend, who so often has done them 'bear's' service, notably when it fought the Babcock test in cow records, and insisted on churn-tests in the vain hope of screening some of the ridiculous claims made by imaginative breeders."

Whether the remarkable churn records credited to some Jersey cows years ago are genuine or imaginary, it is up to the Jersey people to disregard the *Jersey Bulletin* and other influences that are at work to prevent placing the method of performance records upon a basis of authentication by some disinterested official so that the journals and the public will have faith in them. In the phrase of the Missourian, we say—"Show us."—*Dairy and Produce Review.*

Cream SEPARATORS
All about them and other things for the dairy and creamery.
A. H. REID, PHILADELPHIA

THOROUGHBRED LARGE ENGLISH YORKSHIRE
BOARS, 13½ months old, from the imported Sow, SUMMER HILL SUNSHINE 16th. This Sow won First Prize in strong competition.
Animals of this breed attain immense weight, fatten readily when young, and cross admirably with the smaller breeds. Those we offer are of the finest quality and true to type.

A Study in Swine.

ED. HOARD'S DAIRYMAN:—The great state fairs and shows that have been held this season, have been object lessons of immense value to those who having eyes can see. That there were many such at these fairs, an observer of men and a student of agricultural questions could readily determine. Wherever there were exhibits of fine stock, selected fruits, grains or vegetables, improved machinery for lessening the expenditure of human labor and at the same time increasing its productivity, could be seen intelligent and well dressed men and women examining, criticising and discussing the objects at hand.

This, too, in the swine department, a place once thought to be outside the realm of woman's interest and investigation. But the American farmer and his wife are eminently practical people and always generous enough to "bless the bridge that carries them over," and this good office the lowly swine has performed over and over again; therefore, to these people the study of the hog in his great evolutionary processes is always interesting from a financial standpoint, if from no other.

As a matter of fact, however, man's inhumanity to the hog has given his swineship a bad name, and the proverbial uncleanliness of the hog is an undesirable distinction that careless and unwise men men have thrust upon him.

The well bred hog is a clean animal in his habits, if given the chance to exercise his more refined instincts, whereas under man's dominion he has been for many generations, commanded to "root hog or die," and even the alternative does not always redeem the promise of living that is implied, for by the very necessity of rooting in and being forced to inhabit uncleanliness, they die by the thousands of droves. The wonder is not that so many succumb to disease, but that their mortality is not even greater.

Would it be a "bull" to say that thousands of them are forever being saved from an untimely death by being butchered so early?

Now, it is reasonable to assume that the vital spark glows no stronger in the hog than in any of our other domestic animals, yet no other of these animals is so surrounded by conditions of environment and feed so antagonistic to life.

Swine plague and cholera lurk on the farms and in the feed lots of the western breeder. "Sure Cures" are compounded, advertised and guaranteed; but shall we suppose the skill and learning of smaller men shall suspend the working of nature's laws as touching lower animal life, when the greatest skill, learning and investigation of the most trained men doctor human ills not so much in the effect as in the cause?

Herein lies the lesson these hundreds of successful swine breeders, who show the result of their handiwork at our fairs bring to the plain farmer breeder. The animals are well fed and wisely. Their bill of fare is not forever corn, corn, corn, and that too often only what is rejected by the cattle that have passed that way.

These show hogs are given a show, a living chance, at home. Their owners study sanitary conditions for them. Their beds are clean, their food sound and balanced and their drink pure. I may add further that the producer of pork is the purveyor of human food and upon him rests the unwritten, but no less binding, obligations that this food shall go out unto the children of men carrying no contamination. Out of what he eats and drinks, the swine makes a food for man.

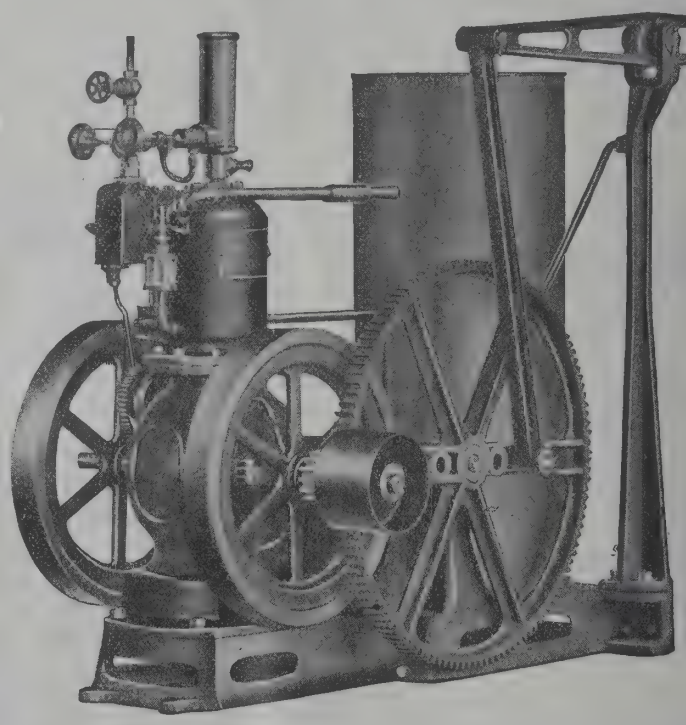
Pa. W. F. MCSPARRAN.

Continuous Stabling of Cows and Other Matters.

ED. HOARD'S DAIRYMAN:—Notes and Comments of Bro. Gould's are always perused with great interest and we must admit his familiarity even with Nebraska's happenings, though more than a thousand miles away. We had hoped the little matter of the overturned and accidently embalmed dairyman might have been kept out of the papers, as we had expected to catch the fellow from the East when he came around again with more of his blessing for humanity (he called it that), but he evidently got experience and concluded not to try Nebraska dairymen a second time for suckers. Had he, or should he appear again, his body will meet a similar fate to our departed brother. But such is human consistency. We are trying to show the Eastern fellows how to better their conditions by planting alfalfa as we do, notwithstanding we have wheat bran to sell, and then you send men out here to lead us astray with formaldehyde.

Woe be to him that comes on Nebraska soil with another dope! Regarding Bro. Gould's continuous stabling of his cows during the winter months, brings to my mind an experience at a Farmers' Institute at my former home in New York. I had my cows continuously stabled during two winters preceding this particular meeting. Some of the neighbors considered exercise most essential for good health. The climax came when the conductor of said Institute, Mr. VanAlstyne, late Supt. of the Model Dairy at the Pan American Exposition at Buffalo, was questioned as to the advisability of stabling dairy cows continually during the winter. Of course, it was up to me for defense, and like the boy on the burning deck, I stood alone.

The question is not as to the length of



DON'T BUY GASOLINE ENGINES UNTIL YOU HAVE INVESTIGATED **"THE MASTER WORKMAN"**

A two-cylinder gasoline engine; superior to all one-cylinder engines. Costs less to buy and less to run. Quicker and easier started. Has a wider sphere of usefulness. Has no vibration; can be mounted on any light wagon as a portable. Weighs less than half of one cylinder engines. Give size of engine required. Sizes 1½, 2, 2½, 4, 5, 6, 8, 10 and 15 horse power. time a dairy cow stands in one place. The question is, is she comfortable?

Since we better understand sanitary rules, ventilation perhaps the most important, there need be no fear of disease, because of their not exercising as it is called. They are exercising, but not in the manner of the horse, for instance, or any other animal not belonging to the ruminants.

I have seen dairy cows in Switzerland, France and Germany who are never out of their stalls except for a necessary reason, during the whole year, and those who know of the rigid inspection by the authorities in the countries named, will readily admit that, unless the cows and environments were satisfactory, the continuous stabling would have been condemned years ago.

It is gratifying to see the trend in the direction of continuious stabling, or at least during the winter months, and will venture to say, where we now know of but a small number who practice this system of keeping dairy cows, we will see hundreds doing so in a very few years, without ever one going back to the barb wire fence method.

I would also say in this connection, as regards the ability of the eastern dairymen being able to compete with their western brothers, bceause of their better adapted (cow) machine, what are the eastern dairymen going to do, when we too have a better cow ?

Let me say right here, when the westerner sees where he can better himself, he is not slow to do so, even if he has got to go into his pocket heavily to make the start. The aggressiveness is here and you can look for better dairy cows out in this neck of the woods any time from now on, and my suggestion to the eastern dairyman is, if he expects to continue to compete with us out here in the future—*learn to grow alfalfa.*

Lincoln, Neb. J. FRED SCHLAPPI.

The Shrinkage of Cheese.

The Wisconsin Station has been experimenting in curing cheese at different temperatures and finds that cheese cured at the usual temperature shrinks about four times as much in weight as when cured at a temperature of 40 degrees Fahrenheit or below. It is thought that the difference would be still greater under ordinary factory conditions owing to less perfect conditions of humidity in the curing room. It is estimated that in a factory making 500 pounds of cheese per day, the loss would equal at least fifteen pounds of cheese per day, or about 3 per cent. Of course the cold process cannot be employed where quick curing is necessary, as the low temperature retards the ripening process. The size and type of cheese also exert a marked influence upon the rate of loss—the loss being greater for a soft than for a firm, and for a small than for a large, cheese. Coating the outside of the cheese with paraffine also reduces the shrinkage. As some loss occurred where the atmosphere was thoroughly saturated with moisture, it was supposed that the shrinkage is not wholly due to the evaporation of moisture from the cheese, but partially to volatile products formed by processes inherent to the curing thereof.

As to the reason why swine fever is not prevalent in France, a corespondent has the following in the "*Agricultural World*":—"A short time ago, I was speaking to a veterinary professor, on the subject of swine fever, and why it makes so relatively few ravages in France. He replied, that in France the peasantry devote extreme care to rearing of pigs in point of cleanliness, in housing and regular and liberal feeding. The loss of one or two small pigs for a small holder is ruin. Then the young pigs are purchased at the maternal sty, where all precautions are observed by the breeder to keep off everything like contagion. And when the animal is fit for the butcher, the latter's agent carts it off at once to the slaughterhouse. Thus the risks of contagion are fewer. In addition to these precautions dictated by self interest, the official veterinary inspectors are ever on the watch; their districts are not large, their remuneration not high, and any neglect of duty involves dismissal, and that means professional collapse. Further, the veterinary is also a sanitary inspector. He knows all the negligent pigkeepers, whose outhouses are improperly kept, pulls their owners up in time and so lessens the risk of infection.

"A Bull By the Horns"

is apt to be dangerous. To use common soap for shaving, or any soap not especially prepared for the purpose, is more so. Such soaps not only dry quickly, but often contain poisonous matter, causing serious trouble.

WILLIAMS' SHAVING SOAP

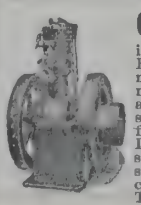
A WONDER POWER.



Users are amazed at the simplicity and service of the 2½ horse power

WEBER JR. GASOLINE ENGINE.

It cannot get out of order. A ten year old boy runs it as well as a man and there's no limit to the number of duties it sets for itself. Less than a nickle an hour runs it. Fitted and tested, ready for business the moment it arrives. Other sizes up to 300 h. p. Write today for free catalogue.

Weber Gas & Gasoline Engine Co., Box 176 Kansas City, Mo.

Gas Engine Excellence

is best represented in the **Buick** Engines---the reason why we make more small engines than any other manufacturer. Are you thinking about an engine to do the cream separating, churning, pumping, feed cutting or other farm work? Do you want guaranteed workmanship and up-to-date construction? If so, it's going to pay you to get our catalog H before buying.

THE BUICK MFG. CO., Detroit, Mich

"ADVERTISEMENT."

THERE IS GREAT DANGER IN CATARRH.

If Left to Run Its Course Unchecked, It Often Causes Death.

Catarrh scatters its poisons throughout the entire system. The stomach and lungs are affected by the droppings that fall into the throat and are swallowed during sleep. Dyspepsia, inflammation of the stomach, bronchitis and consumption are the results. The blood also becomes contaminated and carries the poisons to all parts of the system. Frequently in the more advanced stages, the bones of the head become decayed and the air passages are a putrid mass and create a stench so foul and offensive as to be unbearable. The expression "rotten with catarrh," is not overdrawn or exaggerated.

Stuart's Catarrh Tablets strike at the root of this terrible odious disease and eradicate it from the system. They are a constitutional remedy that cleanses the system thoroughly of all poisons and purifies the blood. Under their influence the head becomes clear, the discharges at the nose and droppings into the throat cease, the lost sense of smell is restored, the eye brightens, the foul breath becomes pure and sweet and the odious, disgusting disease is thoroughly expelled from the system.

A Cincinnati man says; I suffered the mysery and humiliation of catarrh for 12 years. My case became so aggravated that it seriously interfered with all my business relations. The disease became so offensive that I would not venture into any one's presence unless it were absolutely necessary. I tried every remedy that I could get hold of. Some helped me temporarily, but as soon as I ceased taking them, I would relapse into the old condition.

"Finally a friend told me of Stuart's Catarrh Tablets and insisted that I try them. I had about dispaired of ever finding help, but bought a box anyway. I began to notice the improvement within twenty-four hours after I began taking them. Before the first box was gone I felt like another man. I kept up the treatment till I had taken three boxes and was entirely cured. I have never had a recurrence of the trouble from that day to this. My head is clear and well and none of the offensive symptoms of the disease ever trouble me. It has been two years since I stopped taking them."

Stuart's Catarrh Tablets are for sale by all druggists at 50 cents a box.

Omega
The one that Separates

The Easy Way,
The Best Way,
The Only Way
to get best results from your dairy operations is to use the

Of the Frst Order.

Agriculture is a science of the very first order. It counts among its handmaids the most respectable sciences, such as chemistry, natural philosophy, mechanics, mathematics, natural history and botany. THOMAS JEFFERSON.

VETERINARY.

Queries in this department answered by DR. A. H. HARTWIG, Watertown, Wis.

Abortion.

Abortion seems to have invaded my herd; have had three cows lose their calves in the pasture, and as it is six miles from home, can't say what became of the calves, whether born dead or eaten by buzzards or dogs. Had one premature birth (here at home) one month since, and another last night. My cows fail to become pregnant, sometimes returning to bull 8 or 10 times. In your paper I read of using carbolic acid, but no plain directions how to proceed. G. L. W.
Louisiana.

ANSWER.

You have infectious abortion in your herd.

We must first of all isolate the cows which have aborted, destroy the afterbirth and fœtus and thoroughly disinfect the stables in which they have aborted; whitewash the walls and give plenty of light in the stables. About the best agent to apply to the floor is air-slacked lime. Apply it once daily after cleansing. It is advantageous to put the healthy cows to pasture. The cows which have aborted should not be allowed to retain the afterbirth; the same should be promptly and completely removed, and the uterus and vagina thoroughly cleansed by irrigating same with a 1-5,000 soluiton of bichloride of mercury, or other disinfecting agents. This can be done best by using a fountain syringe, and may be repeated once daily until the disappearance of the vaginal discharge. Until this has entirely disappeared, no cow should be used for breeding purpose.

We may also increase the resistance of all the animals by means of food rich in nitrogen and a teaspoonful or two of powdered cramp bark in food once daily.

A Result of Dehorning.

I have a cow that has been dehorned 2 years. About 2 weeks ago matter commenced to run through the stump of one horn. L. V.
Savona, N. Y.

ANSWER.

It is possible that small portions of horn have been loosened during the act of dehorning, which are now sloughing out. Wash the parts clean with soap and water, and inject into the openings a two per cent solution of Creolin once daily.

Will the Schmidt Treatment Damage the Cow?

Is the Schmidt treatment likely to spoil the cow? Have had a cow dry up after the Schmidt treatment. Where can I get the tube?
Trenton, N. J. A. D. A.

ANSWER.

It is not a common occurrence for a cow to lose her milk either partially or entirely, although occasionally it will happen, and usually in such cases where the udder is not kept active by massage. The writer has best success when the massage is applied every hour, which can be done without expense and without a great deal of inconvenience. Every drug store has the small rubber hose and the glass funnel, and they usually keep in stock the ordinary milking tube.

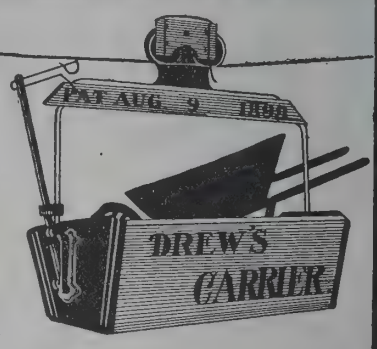
Urticaria.

I have a fine Jersey cow that has an inclination to drink her urine. Is this from some disorder of her blood? She seems crazy for fresh dirt, too.

Every now and then her udder breaks out with a lot of small lumps just above the teats. Sometimes they look yellow, and a scab forms on them, but they never seem to discharge; in fact, some go away after a day or so without forming any scab. SUBSCRIBER.
Los Angeles, Cal.

ANSWER.

Your cow is troubled with urticaria which is due to overloading the digestive organs and causing chronic indigestion, hence the abnormal appetite for urine.



Make a complete change in your ration and give a full dose of physic and follow this with two teaspoonfuls of nitrate of potash twice daily in drinking water or food. You may wash the eruptions with a solution of bicarbonate of soda, using a teaspoonful of the soda to a pint of water. Wash twice daily.

Lump Jaw.

Two months ago I noticed that my cow's right jaw was very much swollen. We threw her and cut into the flesh to the bone, letting out quite a quantity of pus. I then commenced an outward application of spirits of turpentine; in about two weeks see appeared well except the jaw was

THE FEED FOR MILK
according to all authorities should be ground. It not only makes healthier stock and **larger flow**, but it is also an **economy of at least 25%**. But ground feed must be **soft and right** to be **nutritious and palatable.**

GOODBYE, WHEELBARROW

Every farmer who gets a Drew Elevated Carrier has no more use for the barnyard wheelbarrow. The
DREW ELEVATED CARRIER
will carry the manure from the stables to any point in the barnyard, drop it, return automatically, ready for another load.
It is self operating — it turns curves and switches—dumps its load in yard or wagon. Besides carrying manure you can use it to convey ensilage, feed, grain, potatoes, cans of milk, from one point to another. It works so simple and easy that any man or boy can run it.

THE DREW ELEVATED CARRIER
carries labor off from the farm—it is the farmer's labor and money saver. No trouble to put them up—no trouble after they are up.
It leaves barnyard free from posts—keeps the barnyard clean and free from litter. Get one and

NOW Is the time to Subscribe for HOARD'S DAIRYMAN.

still enlarged. I used the turpentine for about a week. About two weeks ago her jaw again became very much inflamed so she could scarcely eat or drink. On opening with a knife, a quantity of pus ran out. I commenced the use of turpentine again, and the inflammation appears to be gone. There appears to be no lump in the flesh or attached to the bone, but the jaw bone itself appears to be enlarged to twice the thickness of the bone in the other jaw and the enlargement on the inside and outside seem about equal. What would you term the disease? Will my present treatment cure her? Is her milk fit to use as a diet? I. N. S.

Monterey, Cal.

ANSWER.

Your cow has lump jaw, which has become chronic, and will likely never be cured, as it has become attached to the bone and same is diseased, which will continue to break open and discharge. There is no cure for this stage of lump jaw and it is advisable to get her out of your herd as soon as possible. It is not safe to use her milk for diet.

Abortion.

We would like to know if there is anything we could do to prevent cows heavy with calf from having them too soon? How long after can we safely breed, and whether the bull is ruined, that has been used on such cows?

Nortonville, Kan. W. BROS.

ANSWER.

See abortion this issue for full information.

You may also disinfect your bull in the same manner as cows are irrigated and with the same solution, before and after serving a cow. Introduce the rubber hose into the sheath and allow the solution to enter same and flush thoroughly.

Hog Cholera.

Some of my hogs have a disease that I can not find out what it is. They stop eating. Their eyes settle back in the head and the next symptom is that they pant like a horse with the heaves and that will last from two to three days and they die. C. L. W.

West Valley, N. Y.

ANSWER.

Pick out your healthy hogs and make new and clean quarters for them away from the diseased ones; have the pens thoroughly disinfected and do not allow them to come in contact with each other in any way. There is but little to be done if a hog is once down with it, but the secret of success is in preventing it. You may also feed a teaspoonful of creolin, to each 200 pounds of hogs, in the food twice daily.

Barrenness.

I have five young cows which all came in this spring and all did nicely except one, which aborted. I did not take her out of the barn as I had no other place for her, and I have been unable to get one of them with calf this summer. Have tried four different bulls and they have all failed. H. A. C.

Rock Elm, Wis.

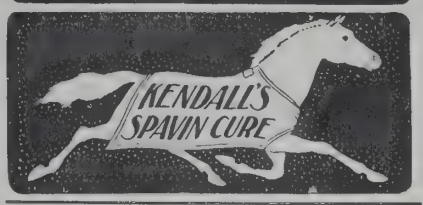
ANSWER.

See Abortion, this issue, for the results of retention of the placenta. It is likely that the uterine secretions are still of an acid reaction, the result of abortion.

Inject a solution of bicarbonate of soda into the uterus via vagina with a syringe, taking a teaspoonful of soda to each pint of water. Repeat this twice or three times a week for about three weeks, or until she comes in heat, then breed her again.

Horse Owners Know

from long experience in treating such characteristic ailments of the horse as **Spavins, Ringbones, Splints, Curbs** and all forms of **Lameness** that the one reliable remedy is



Kendall's Spavin Cure.

Ferndale, Wash., Dec. 17, '02.

Dried Beet Pulp.

ED. HOARD'S DAIRYMAN:—Will you kindly give me your opinion of dried beet pulp as a feed for milch cows, and what should it be fed with, and what is it worth compared with bran at $20 per ton?
Richmond, Mich. E. B. P.

The Senior Editor fed a limited quantity of the dried beet pulp a year ago, and found it desirable food. It was relished excellently well by the cows and gave a good increase to the milk flow. Owing to excessive freight rates we reluctantly were obliged to discontinue its use. We believe it would prove a valuable alternating feed in the way of giving the cows a change. Many dairymen do not appreciate the advantage of making occasional changes in the ration. It adds much in keeping up the relish for food in the cows.

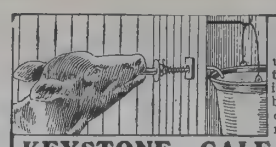
For example: Feed bran as the staple grain food for a few weeks; then change to corn and oats, or barley and corn ground together; then to gluten feed, dried beet pulp, or the molasses feed, or indeed any other of the first-class concentrated feeds.

In this way the cow does not become cloyed or off her feed near as often as if one concentrate or another is fed steadily.

We find also that it is a good thing to feed all grain food on corn ensilage.

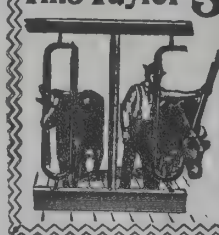
Wisconsin Law on the Right of Way.

J. L. H., Waukau, Wis.—I have forty acres of land on which I live, and it is the back 40 of 100 acres. My deed calls for a right of way along the line of the other farm. Has the other man any right to build fences across my road and compel me to open and shut gates every time I go to and from my place?



Answer: Our Supreme Court has held "that the owner of land, subject to the right of way, may maintain a gate across the way, if such a gate is necessary to rendered the reasonable use and enjoyment of his lands and does not unreasonably interfere with the use of the way." If your deed simply calls for a right of way and does not specify what kind of of a way it shall be, then your neighbor can build a fence across the right of way and compel you to open and close the gate. But as indicated in the decision quoted above, the fence must be necessary for the reasonable use of this land and must not unreasonably interfere with your use of the way. A reasonable use of his land and a reasonable use of your right of way, are the criterion by which to judge whether or not the fence is proper.—*Farmer Sentinel.*

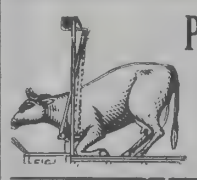
Physic for Milk Fever.

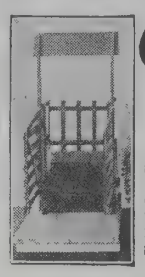


ED. HOARD'S DAIRYMAN:—The writer was recently called to treat a cow that was down with milk fever. On my arrival I found that she was unconscious and laid all stretched out and with every breath a groan, but before my arrival she had been drenched with 4 quarts of flaxseed tea and ½ pound of soap dissolved in it. The next was 4 oz. saltpeter, 40 drops aconite with a quart of water. I applied the Schmidt treatment and in the course of 2½ hours I saw some improvement. I applied the second dose and inside of 30 hours she was on her feet.

I left her for the better, but inside of 24 hours I was called again and found her much worse, labored breathing and a heavy discharge from the nose as though she had contracted a bad cold or pneumonia had set in, no appetite and had been four days sick. I applied the Schmidt treatment again with stimulants and it seemed to revive her at once. Previous to this her bowels refused to act and I gave her pound doses of salts every 2 and 5 hours till they moved. The first dose of flax and soap gave her a severe purging, then they stopped. Did the last physic injure her? After the last treatment, within 10 hours, she began to grow worse, fever increased till she died the 8th day.
Concord, Wis. J. T. G.

You should never give large doses of medicine when a cow is in a comatose condition as the medicine is liable to run down into the lungs and suffocate the animal. When you had applied the Schmidt treatment you should give no more medicine except small doses of heart stimulants. Large and repeated doses of physic are dangerous, as they deplete the animal and may cause enteritis as the mucous membranes are more or less irritable during and after this disease is in progress.





SENT under positive guarantee to refund money if not satisfactory. No bolting food. Perfect digestion. All tinned, no rust, easily cleaned.
KEYSTONE CALF FEEDER.
Used and endorsed by leading dairymen, agricultural colleges and experiment stations. Complete with extra nipple, $1.50, express prepaid. Book free. Agents wanted.

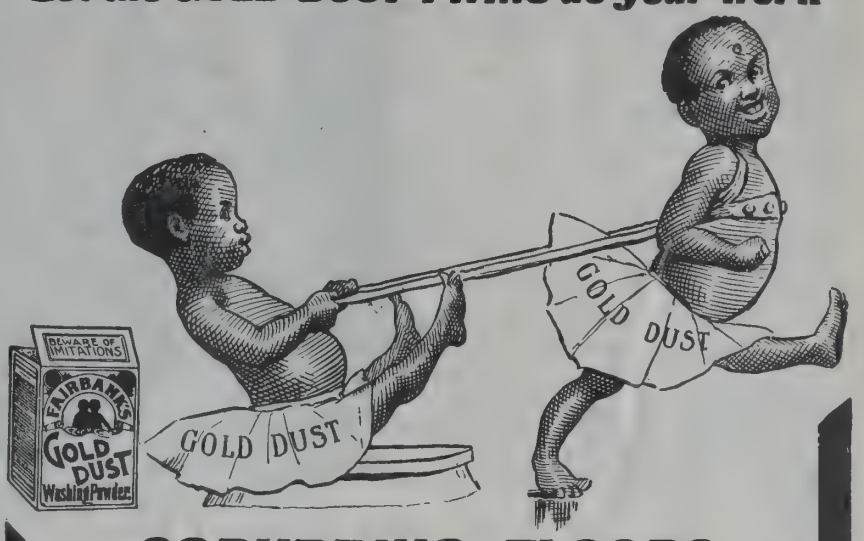
Shall we Educate the Farm Boy?

Shall we educate the farm boy? I, for one, do not dare answer "no;" but the question sets me thinking, and may I hope it sets you doing the same. Shall we, indeed, educate the farm boy? If so, how far, in what direction, by what means, for what?

For what shall we educate the farm boy? A hundred thousand farmer fathers answer in no uncertain voice, "For the farm." A million men of the work shop and the marts of trade echo the answer, "Yes, for the farm. Don't send them to us. Keep them in the free air of God's green country." But what say the boys themselves? A multitude answer, "For anything; but above all give us an education," while another great multitude look up from their toil with a vague, wondering, ambitionless gaze, and answer not at all.



The question "For what?" must be answered in every home by the boy and his parents, after nicely weighing all the thousand and one conditions that surround the boy, and carefully studying the boy himself. It will not do to say, "This boy was born on a farm, and therefore educate him for the farm—keep him on the farm." Common sense would dictate that we educate him for that which God intended him, and it is not so hard to determine this as men suppose, if we set about it right. But if everything in and about the boy marks him for the farm, then what? Well, the question of education for this boy resolves itself into the subordinate questions, How? Where? To what extent?

Let us answer the "how." Shall we send him to college? If so, what kind of a college, and what kind of a course? Shall the course be classical, scientific, philosophical? Shall it include Greek, Latin, French, German, moral and mental philosophy, political economy, astronomy, higher mathematics? Shall we lay the foundations deep in the substrata of ethics, history, literature? Try any one of these, and the chances are that the boy will be lost to the farm forever. For every one boy who goes to the classical school for training and returns voluntarily to the plow, ten thousand turn their backs on that symbol of rural life. Send a country boy to college and expect him back to water stock and cut corn, and you are doomed to bitter disappointment. But may he not pursue at college such scientific studies as form a natural part of the equipment of an educated farmer (so called), such as chemistry and botany, and return thus equipped to take up his life work on the farm? He may and he may not. The chances are he will not. College life will have done its deadly work; the boy will have breathed in an atmosphere heavily laden with professionalism, and the allurements of law, medicine, literature, or business will have bound him with links of steel. Observation leads me to say that the farm boy who goes away from home to institutions of learning, to mingle with boys, seventy-five per cent of whom come from city and country towns, and are bound for city life, will never return, save for periodical visits to the old folks. Twenty-five per cent of the membership of my class in college were boys from the farm, and not one of them returned to the paternal roof tree.

Prof. Vincent of the Chicago University says that if he wanted to make a blacksmith of a boy he would send him to college; but we haven't yet heard from the boy. Blacksmithing is honorable; but if when a boy has gone through college and got an insight into the great world of knowledge, he has no ambition in lines of work higher than that of blacksmithing, there is something wrong with the boy.

Then the query suggests itself, What about the agricultural college? Here the objection holds to a less extent, but there is still danger. Away from the sometimes monotonous round of farm work, in an atmosphere of comparative freedom from restraint, often in a populous community, learning to ape the thoughts and manners of the city about him, with a growing insight into the broad fields of knowledge opening before his eyes by contact with books and men of culture, the chances are that he becomes restless, and wonders if after all the country is the place for him. May there not be, he asks, greater returns for his efforts, a wider scope for his abilities, in other directions? By insidious advances the city, with its myriad attractions, forces its way into his heart and mind, and the old ambition fades into an

RIFLE & PISTOL CARTRIDGES.
"It's the shots that hit that count." Winchester Rifle and Pistol Cartridges in all calibers hit, that is, they shoot accurately and strike a good, hard, penetrating blow. This is the kind of cartridges you will get, if you insist on having the time-tried Winchester make.
ALL DEALERS SELL WINCHESTER MAKE OF CARTRIDGES.

impossible reality. He still loves the farm, but ambition, "by which vice fell the angels," has turned his gaze to other and, as he thinks, fairer fields. Even in such schools as give to the employment of farming the most attractive coloring there lies a danger to the farm boy who would honestly strive to remain a farm boy, though an educated one.

The problem with every agricultural school must be to keep the life of the farm attractive, to teach the nobility of labor with the hands when directed by the understanding mind, to present farming as a pursuit requiring the best talent and affording the richest rewards of study and endeavor, to engender the spirit of emulation among boys of the farm class, and to religiously exclude every influence that tends to magnify the pleasures and profits of city life as compared with those of the country.

But the "how" comes fraught with the greatest significance to the boy who cannot go to either the classical or the agricultural school, and who yet wants to be an educated farm boy. This question must at times rise like Banquo's ghost before that boy's father, too, if he have conscience and heart. How shall we educate for the farm the farm boy who cannot go to the agricultural school? I offer a few suggestions. The number could be multiplied.

First, by early giving the boy a position of independence, by never making him a slave, a hired hand, mere help; by giving him, as soon as he knows the difference between "mine" and "thine," something of his own—a horse, a pig, a cow, a calf, a few hens, an acre of ground—something that he may see, and feel and enjoy, and work over and help to increase, something that shall be his own; by adding to his belongings as he grows older, letting him earn these additions of you will (and indeed, this is the better way), but at all events letting him early know the meaning of growing responsibility, and realize the value of money and work. This begets strength of character, pride of possession and purpose in life.

What of it? In addition he has also, after all, the kernel of an education. It sets him thinking, planning and working. Perhaps ere he has reached manhood's estate he has acquired to himself a quarter of the old farm, acquired self-reliant manhood, and by independent, self-directed study he has learned, until perhaps he may even teach his elders. Such a boy soon becomes a reader of farm literature and a student of farm matters. He anxiously waits the coming of the next farm paper, that he may learn to correct some mistake or improve an old method. He is found trying new things and discussing with you or with his associates ways and means which, were he a mere dependent, he would let others solve for him instead of attempting the solution of them himself.

Second, to be his companion. Too many fathers withhold from their sons the pleasure, comfort and help of their comradeship. What a mine of experience is hidden under the snowy locks of that old farmer! Some one has said that Mark Hopkins on one end of a log and a student on the other would make a university. What schools could impart the learning that the old farmer has hewn out of wood and stone and sod? And yet the boy who hungers and thirsts for that knowledge is but a boy to him—perhaps a lazy, shiftless boy, too bad to waste words on. The boy cannot go to college. because his father cannot or will not send

FREE VETERINARY ADVICE DURING NOVEMBER

Until December 1st, Dr. Hess (M.D.,D.V.S.) will furnish every reader of this paper a letter of advice and a special stock prescription, free of charge. This information is free to users of Dr. Hess preparations at all times, but this month we offer it to those who have never used our goods as a means of demonstrating Dr. Hess' ability to formulate stock preparations. If you are in need of special veterinary advice, describe your difficulty fully in a letter to Dr. Hess & Clark, Ashland, Ohio, care of Information Bureau, and the letter of advice and prescription will be furnished you free, providing you state what stock you have (number of head of each kind), what stock food you have fed, and mention this paper. Enclose 2c stamp for reply.

Feeders who use Dr. Hess Stock Food are free from the usual fears that attend the last few weeks' feeding, and the danger of failing weight from lost appetite in the very last days before marketing. Dr. Hess Stock Food, the great stock tonic, keeps up appetite and compels the digestion of all the foods eaten—that means economical feeding and a wonderful development of solid flesh and fat; shortens the feeding period thirty to sixty days; prevents disease by keeping the animal in perfect physical condition; gives that thrifty and vigorous appearance that makes cattle "top the market" at selling time.

Dr. Hess Stock Food

is a product of science, formulated by Dr. Hess (M. D., D. V. S.) If the medical and veterinary colleges know of nothing better it must be good. No unprofessional manufacturer can equal it.

Our Information Bureau.—For any disease or condition for which Dr. Hess Stock Food is not recommended, *a little yellow card enclosed in every package* entitles you to a letter of advice and a special prescription from Dr. Hess (M. D., D. V. S.) In this manner you are provided with a universal treatment for all stock diseases, either in the Stock Food itself or in the special prescription to which the little yellow card entitles you. Indorsements from physicians, scientists and feeders furnished on application.

Dr. Hess Stock Food is sold on a written guarantee, 100 lbs. $5.00 (except in Canada and Pacific Slope) **smaller quantities at slight advance. Fed in a small dose.**

DR. HESS & CLARK, Ashland, Ohio.

Also Manfgs. of Dr. Hess Poultry Pan-a-ce-a and Dr. Hess Healing Powder.

Simply Send a Postal

and ask us to mail you our new illustrated stove catalogue, and we will forward postpaid our complete catalogue of stoves and ranges, which illustrates and describes everything in the stove line for cooking and heating worthy of your consideration—all at prices decidedly low. We sell only the best grades, avoiding the very cheapest. If you want an honestly made stove you cannot afford to place your order until you have seen our stove catalogue. A postal card will bring it.

$4.00 as here illustrated.

$3.20 is our price for a good stove with a 9¾-inch firepot. It is a much better stove than some firms sell at a higher price, but if you want the best send for our stove catalogue and read about our famous Home Oak stoves. The illustration shows our well known Home Oak stove; a very powerful heater made of No. 18 gauge cold rolled steel and finished with artistic nickelplated trimmings. It is 43 inches high, 9¾ inches round and weighs 63 pounds. $4.53 buys larger size weighing 75 lbs.

$5.87 is the price of the most popular size of the Home Oak stove. 48 inches high, 13½ inches round, 13¾ inch firepot, weight 108 pounds. The Home Oak stoves are the best, not the cheapest, and are fully guaranteed.

$1.14 Air-tight heater made better than others on the market and cheapest at our price. We do not sell the cheapest that we can make. This air-tight heater at $1.14 is a better bargain than others at 95 cents up. It pays to buy the best.

$2.88 for an honestly made kerosene oil heater. Other styles, $3.35, $3.68, $4.80, $7.00 and $7.35. 34

Don't waste your money by purchasing a cheap stove. Get an honestly made one even if does cost a trifle more. Our stoves are all honestly made and sold at remarkably low prices. Our free stove catalogue describes our handsome base burners, also a score of other styles—all good, all low priced. You cannot afford to buy until you have heard from us. Simply write a postal card and ask for stove catalogue. We will send it promptly. Address

him; and yet the old man, with a school in his own head, covering nearly every point of practical farming, from weeds to weather, deliberately shuts the door to the boy, and throws away the key. No wonder the boy is ignorant! The wonder is, he isn't a criminal. Maybe he is. A farmer father should himself be a student of the farm, and his boy should be his fellow student. The father should talk to the boy, explain the whys and wherefores, catechize him, teach him, drill him, until, when he is able to count twenty-one years, he has graduated from the home school and learned all that the father has learned in the hard, expensive school of that father's experience.

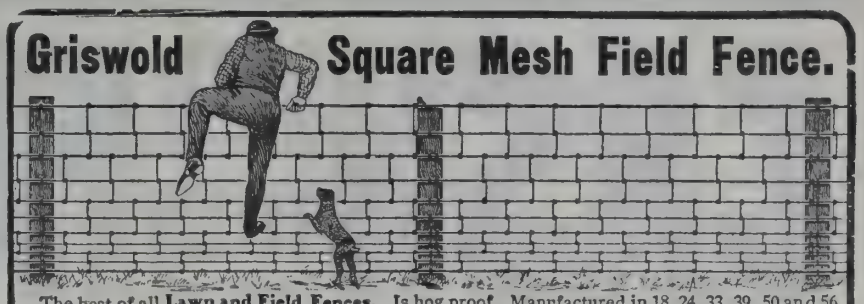
Third, give him an attractive home. This must be, if you are to keep him on the farm. Make the home a place where he shall want to stay. Give him company and books and papers, a room of his own and decent furniture. Surround him with the most attractive farm literature. Wherever he turns let him find wise guidance in the line of his work. At first he may read sparingly; at last he will read eagerly. Thus you can almost bring the agricultural school into your own home. Books and papers in the line of farm work are offered on every hand, much of it of a high order. Buy it. Be extravagant in this if in anything.

The farm boy who is brought up under such conditions will come very near being an educated boy. Shall we, then, educate the farm boy! Yes, a thousand times, yes. If he is to be kept on the farm, send him to a good agricultural school if you can—and the chances are you can by a little heroic sacrifice—and while he is there watch his environment and development; but most of all, give him the home schooling that every father owes his boy. Every man may be immortal on the earth, if he will but strive to live in the lives of his children. Empty your heart, your experience, your wisdom, into his life, and early let him feel the touch of your sympathetic interest. This, with the fostering in him of a spirit of independent manhood as he grows older, will make of him an educated farmer—educated enough, at least, to fill the Creator's purpose in him, and that should be enough to fill yours.—W. C. SPRAGUE, Editor of American Boy, in *The Farm Home.*

Bogus Butter.

How Solicitous for the "Poor Man" the Oleo Dealers are When they Resort to Every Trick to Sell Him Oleo for Butter.

A Washington, D. C., correspondent writes a comment to *Country Gentleman* of interest as follows:



One of this city's daily papers has recently received an anonymous communication which relates to a subject of considerable interest to your readers. This letter, purporting to be from a "workman," contains the following:

"When the recent attempts of Secretary of the Treasury Shaw, to reduce the surplus accumulations in the United States Treasury are considered in connection with the tax of 10c per pound on oleomargarine, imposed by the present administration, it would seem that the republican government has done a very unwise thing, to say the least, to tax the workingman's butter on his bread, in order to pile up a surplus that threatens a financial panic. If the tax is not imposed for revenue, the bill is in itself a fraud, for it claims to be a revenue bill, which is the only basis on which it can stand. No other country on the globe taxes oleomargarine or butter, and a necessity for such taxes in a free country is not clear to any thinking mind."

The editor's comment on the above expresses some doubt as to its being the production of a workman.' Indeed suspicion strongly points to the writer as being an agent of the oleomargarine interest, because of the reference to the oleo law as a revenue producing measure. That was the Shibboleth of the oleo fighters in Congress in the attacks on the bill, and it has formed the basis of legal contentions aimed against its administration. The fact is that most laws which seek to correct evils or to achieve general results, through the imposition of taxes, are framed as revenue measures and are so treated in the formal course of their enactment.

This law was enacted, and is now enforced, as far as possible, for the purpose of putting a stop to certain frauds on the pockets of the people. Oleomargarine was sold as butter and at butter prices in enormous quantities. The producers and

Griswold Square Mesh Field Fence.

The best of all **Lawn and Field Fences.** Is hog proof. Manufactured in 18, 24, 33, 39, 50 and 56 inch heights; in 20 and 40 rod rolls. The narrow widths can be supplemented to any height desired by Barbed or Plain wire, or two strand twisted Cable wire. Manufacturers of **Diamond Mesh Fence. Plain, Galvanized, Barbed or Telephone Wire. Wire Nails and Hay Bale Ties.** Write for illustrated catalogues and price lists. **Dillon-Griswold Wire Co., Sterling, Ill.**

Flavor

The market value of butter is unquestionably its flavor, and its flavor is unquestionably affected by the quality of the salt used. Prize winning butter makers always use DIAMOND CRYSTAL SALT—"*the Salt that's ALL Salt*"—to insure that *winning flavor*. Its pure, dry flakes quickly dissolve—assimilate *evenly* through the butter, and add a keeping quality that is inestimable. No waste—no grit—no mottled effect. The only salt in the world that's all salt. Dairymen will find our illustrated booklet "Just Salt" contains valuable hints. We send it free.

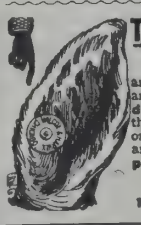
DIAMOND CRYSTAL SALT CO., ST. CLAIR, MICH.

BUTTER FOR UNCLE SAM

THE CONTINENTAL CREAMERY COMPANY
TOPEKA, KANSAS

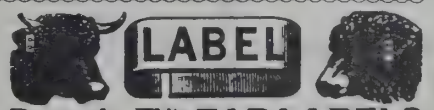
Has been awarded the contract to supply the United States Navy with half a million pounds of butter for the ensuing year.

For this purpose only the best quality of butter is used, and its keeping quality must be made of the very best, owing to the fact that the entire year's supply must be made within a few months and it is carried through all conditions of climate.



The government has made a thorough study of supplying butter to suit the requirements of the Navy and as a result it has laid down some very exacting standards to which those who bid for these contracts must comply. One of the few concerns who can fulfill these requirements is the Continental Creamery Co. and it was awarded this contract, which is the biggest single order for butter ever filled.

This company produces the greatest quantity of fancy creamery butter in the world, all of which is made from pasteurized cream. Surely it knows something about making good butter. It also knows from actual experience and the investigations of its chemists, that one of the factors in making good butter is



WORCESTER SALT--IT USES NO OTHER

CASH FOR YOUR FARM

(OR OTHER REAL ESTATE)

NO MATTER WHERE IT IS

If I did not have the ability and facilities to sell your property, I certainly could not afford to pay for this advertisement. This "ad" (like all of my other "ads") is practically sure to place on my list a number of new properties, and I am just as sure to sell these properties, and make enough money in commissions to pay for the cost of this "ad" and make a good profit besides. That is why I have the largest real estate business in the world to-day.

Why not put your property among the number that will be listed and sold as a result of this "ad?"

I will not only be able to sell it—sometime—but will be able to sell it quickly. I am a specialist in quick sales. I have the most complete and up-to-date equipment in the world.

I do not handle any of the side lines usually carried by the ordinary real estate agent. I do not make any money through renting, conveyancing, mortgages, insurance, etc. ***I must sell*** real estate—and lots of it—or go out of business. I can assure you I am not going out of business. On the contrary, I have already sold twice as many properties this year as I did during 1902 and expect to sell ***several times*** as many next year.

Eight years' experience, offices in principal cities from Boston to San Francisco, hundreds of representatives and an expenditure of over $100,000 a year in advertising, gives me better facilities for quickly selling your property than any other broker anywhere.

It doesn't matter what kind of a property you have; it doesn't matter whether it is worth $500 or $500,000, or in what state or territory it is located. If you will send me a description including your lowest cash price, I will tell you how and why I can quickly convert it into cash, and will give you my complete plan (free) and terms for handling it. The information I will give you will be of great value to you, even if you should decide not to sell. Fill out the upper coupon on this page and mail it to me to-day.

If you want to buy any kind of a property, anywhere, fill out the lower coupon on this page and mail it to me to-day. I will guarantee to promptly fill your requirements and save you some money.

W. M. Ostrander, 250 North American Bldg. PHILADELPHIA.

CALIFORNIA.
Find enclosed check for $407.00 in full payment of balance of your commission on the sale of my timber lands in this place. I must say, at this long distance, it is certainly wonderful how you are able to find the parties who wish to purchase. I never more willingly paid for services than I do in this case. I wish you all the success which you so richly deserve.
C. P. Higgins, Monroe, Cal.

NEW JERSEY.
We have received the check in full payment for our New Jersey property. It is a remarkable fact that this property has been on the market and in the hands of various agents for more than twenty years, and your success in making a cash sale in a short time is proof to us that you are the only agent who ever made a real effort to dispose of it. Your methods are up-to-date.
Mr. & Mrs. O. C. Whittemore, Athol, Mass.

FLORIDA.
Yours, 26th inst., containing money-order for payment on Florida property is received. I thank you for the efforts you have made to effect a sale.
Wm. S. Tancre, 1120 G St., N. E., Washington, D. C.

NEW YORK.
I am in receipt of your letter acknowledging draft covering commission on the sale of my office building, at Amsterdam, N. Y., for $10,000 cash. I wish to thank you for the interest you have taken in the matter, and express my satisfaction at having entrusted you with the business.
W. G. Barnes, Seattle, Wash.

SOUTH DAKOTA.
I am in receipt to-day of your check in full settlement for my Brown Co., S. D., farm which you have sold for me. Your ability to sell at long range has been proven to my satisfaction. Thanking you for the attention given my case, I remain.
David Armstrong, Hayesville, Ohio.

COLORADO.
I received your check to-day covering the full amount realized on my building lots at Boulder, Colo. I am pleased with the way you have handled this matter, and can endorse your method of completing quick sales. I again thank you.
H. McC. Hart, Box 227 Halifax, Nova Scotia.

IOWA.
I approve of your up-to-date and thorough methods displayed in conducting your business. The several farms which you have secured for my clients have all proven satisfactory, and I shall certainly call upon you for more properties from time to time as I find the buyers.
L. T. Graves, Emmetsburg, Iowa.

VIRGINIA.
I hereby acknowledge receipt of your check, payment in full for the Bedford Co., Va., farm you sold for me. My dealings with you have been entirely satisfactory. I wish to thank you for the attention you have accorded me.
Mrs. E. B. Stevens, Baltimore, Md.

MINNESOTA.
I have to thank you, as it was through your "Monthly List" that I found my bargain, and I will truly recommend you as the safest and best real estate dealer and agent in the United States.
Frank G. Wilson, Cyrus, Minn.

PENNSYLVANIA.
I have received in cash, my price, less your commission, in full payment for my Hollidaysburg property. Your services have been highly satisfactory in every way, and your promptness in finding a cash buyer is substantial evidence of the superiority of your methods. I earnestly recommend your services to any one having real estate for sale.
J. Guss Ditting, Hollidaysburg, Pa.

OHIO.
I received the deed and papers to-day for the farm which you secured for me in exchange for my building lots. I wish to thank you for the attention you have given this matter, and from my experience can recommend you to any one wishing to find property or to any one wishing to dispose of property.
J. O. Moss, Cambridge, Ohio.

TEXAS.
I have finally completed a satisfactory trade with your client, in which he accepted in part pay for his property my Manvel, Texas, real estate. I appreciate the efforts you have made in this direction, and am satisfied with what has been accomplished. Should I have any further dealings in real estate I will certainly accord you the first opportunity of handling the business.
D. W. Lentz, Manvel, Texas.

ILLINOIS.
On September 15th I mailed you the balance of commission due you for selling my Illinois farm. I thank you for the promptness and the businesslike manner in which you handled this transaction, and wish to express my gratification that so little time elapsed between the time I placed the property in your hands and the time the buyer arrived at the farm.
P. G. Ragains, Norman, Okla.

KANSAS.
Your letter received, enclosing check for one of my Kansas farms, sale of which you have just completed. I am pleased that the many difficulties which arose in connection with this matter were successfully overcome.
Charlotte D. Knox, Peekskill, N. Y.

MICHIGAN.
I am in receipt to-day of your check and papers in final settlement on the sale of my Michigan farm. I am well pleased with the manner in which this transaction was handled, and can say from personal experience that your methods are straightforward and show results.
George Martin, Platte, Mich.

NEW MEXICO.
I have received deed and other papers for the transfer of my property in Messilla Park, New Mexico. I desire to compliment you upon the good and prompt service, and I gladly recommend your services to any one who wants to buy or sell.
F. W. Brady, Scranton, Pa.

ALABAMA.
Your letter and your personal check came duly to hand. Thanks. I really think you are a gentleman above the average, and the best and fairest real estate man I ever dealt with. No honest person can find fault with your rules governing the advertisements and sale of lots and farms.
W. T. Trammell, Scottsboro, Ala.

NEBRASKA.
I beg to acknowledge check in settlement for the Hayes Co., Nebraska, quarter section, the sale of which you have just completed. This, I believe, is the last one of the sales which you have made on my western holdings. I appreciate your success in disposing of the several properties placed in your hands, and feel satisfied with the attention you have given me.
H. J. Wynkoop, Bath, N. Y.

SOUTH CAROLINA.
The transfer of my property, made by you, was completed to my entire satisfaction. I thank you for the prompt and careful service.
R. P. Ranson, Williamston, S. C.

WISCONSIN.
I have the pleasure of acknowledging your check for $1268.00, in settlement for the Jackson County, Wis., land, sale of which you have just completed. Your efforts have been entirely satisfactory to me, particularly as the land was only placed in your hands the latter part of February.
Henry Griffeth, Shandaken, N. Y.

MARYLAND.
I received your letter this morning, enclosing check for my Maryland farm, the sale of which you have just completed. I consider your method of advertising and system of handling property furnishes the surest means of converting real estate into cash, which the present generation has an opportunity to enjoy. I thank you for your promptness in this matter.
J. Burns, 7 W. 98th St., New York City, N. Y.

MASSACHUSETTS.
Your letter notifying me of the sale of my Dorchester property through your office is at hand. I must say you have handled the matter to my complete satisfaction. I have had my property in other agents' hands before who have put it on their books and seemed to forget it at once.
V. Harris, Rochester, N. Y.

retailers were reaping an exorbitant, dishonest profit. It was found that the only way to prevent this peculiarly offensive form of fraud was to impose a differential tax on artificial butter, one tax of 10 cents a pound on all such products colored to imitate butter, and an insignificant tax of a fraction of 1 cent a pound on uncolored oleomargarine. Thus it was sought to permit those who wished the cheap form of artificial butter to secure it at the former cheap rate, while those who wished it colored to resemble butter could buy at a higher rate, but one which was still somewhat lower than the price of genuine butter.

The incentive to defraud the customer, which under previous conditions proved so tempting, was removed. The act was clearly not designed as a producer of revenue, for if all oleomargarine were marketed uncolored, the revenue would be less than sufficient to meet the cost of enforcement. The workingman who demands a cheap butter imitation can obtain it today just as surely as he could before the passage of this law. And if he has compunctions against putting it uncolored on his table, he can cheaply provide himself with a coloring agent. Furthermore, this statute is not a partisan product. At no time did party politics enter into the case. The law was passed, upon the non-partisan demand of the dairymen of the country and to meet the needs of the general buying public, regardless of party.

It is learned from an official of the Internal Revenue Bureau that the Commissioner, after a full hearing, having decided that the corporation of which Wm. J. Moxley is the head, did and does use artificial coloring matter in their manufacture of oleomargarine; that the corporation has started suit in the United States circuit court at Chicago to recover $35,000, which it was compelled to pay as a penalty for alleged violation of the law. While this is known as an action in assumpsit and will probably be tried before a jury, there are important law questions in the suit which will be argued before the judge, thus giving the court the opportunity to review the argument made before the department some months ago, that palm oil was the principal ingredient used by the Moxley corporation in coloring the oleomargarine, and that such coloring matter did not constitute artificial coloration.

Milk and Brain Power.

At a public meeting held at Palo Alto, the seat of Stanford University, to discuss the movement to establish a sanitary dairy on a co-operative basis as a means of securing pure milk for the town, Prof. I. P. Roberts of Cornell University, one of the most noted authorities on agricultural affairs in the country, was present and delivered an address on the relation of food to mankind. The address was very interesting, according to the synopsis given by the *Palo Alto Times* from which the following is taken:

He spoke of the effect of food upon civilization, showing that those nations which used the most concentrated foods, which give a reserve of mental power, have attained the highest civilization. The Americans lead the world because they use more milk, butter, sugar, fruit and wheaten bread than any other nations. The Turk, for instance, uses only one-tenth of the sugar and one-fortieth of the butter that Americans use. No savage or barbarian people can be civilized until their food is improved. Neither can breeds of animals be improved without care in the food used.

Milk and butter are the most perfect foods, giving, in concentrated forms that are easy of digestion, all the elements needed. Butter, he said, is concentrated sunshine, and sunshine stimulates, as may be shown by the superior physical appearance of Californians.

Dr. Roberts showed plainly the necessity for the use of milk as food, and for the utmost care in producing and dispensing milk.

He spoke of the difficulty and danger that had arisen at Ithaca through an epidemic of typhoid. The prosperity of Ithaca depends upon Cornell, and if students fail to enter the university the town is injured financially. The prosperity of Palo Alto was closely linked with Stanford, and if conditions should arise to keep students away property values would be decreased, and the town would retrograde. It was therefore important to use the utmost care to prevent unsanitary conditions.—*Dairy and Produce Review.*

A Good Word for Tubular Separators

The following item is from that great farm journal, the "New York Tribune Farmer", of October 29th, 1903. We hope it will not lessen the pleasure other separator manufacturers take in telling what sometimes seem rather large stories of the number of machines they have made—or are going to make.

"The remarkable business being done by P. M. Sharples, manufacturer of the Sharples Tubular Separator, at West Chester, Penn., is witnessed by the fact that he is again enlarging his plant. Last year large additions were made which it was supposed would meet all demands for manufacturing and storage. But the inability to keep up with their orders during the past year determined the necessity for the buildings now being erected with all possible speed. They are a brick boxing and storage building, 272 feet by 32 feet in size, and a blacksmith and tool maker's shop, with room for tinning furnaces, 45 feet by 100 feet. The West Chester factory was already the largest in the country. Nothing short of phenomenal demand for the popular Tubular Separator could make necessary the extensive enlargements at this time. The prospects for the Tubular seem to be exceedingly bright. The outlook for the immediate future gives promise of taxing to its full capacity the great plant, with all its superior facilities."

from your hogs. If you are feeding for the market you will find they fatten faster and keep in best condition if you give a ration of the genuine

Alma Dried-Molasses Beet-Pulp with the grain. The reason for this is that this food increases the appetite and the hogs can eat more; and as it also aids digestion and assimilation they get all the good of all they eat.

Cotta & Jacobson, Kankakee, Ill., write: "Book our order now for two more tons of Dried-Molasses Beet-Pulp to be shipped immediately. We don't want to be without this feed a single day. We have never found anything we like better for hogs."

The Alma Dried-Molasses Beet-Pulp is the best food for sows before and after farrowing, and for young pigs.

It keeps them healthy and prevents disease. Send for our booklet describing how Alma Dried-Molasses Beet-Pulp is made. It will interest you.

Do not confuse this with wet beet pulp which freezes and ferments, or with common dried pulp containing no additional sugar. It takes 16 tons of wet pulp to make one ton of our Food, and it keeps indefinitely. The genuine Alma Dried-Molasses Beet-Pulp contains 72 times as much sugar as wet pulp, and nearly 5 times as much as common dried pulp. Write today. Address

Official Tests by the Wisconsin Experiment Station.

ED. HOARD'S DAIRYMAN:—Your Wisconsin subscribers may be interested in the following information concerning the so-called Official Tests of Dairy Cows, conducted by this Experiment Station during the present fall. These tests are of two kinds, viz., one day tests, conducted once every month throughout the year, and tests continued for seven or more consecutive days. The former tests are conducted in conjunction with the American Guernsey Cattle Club, and, privately, for one Jersey breeder, Mr. F. H. Scribner of Rosendale, Wis.; the latter tests are conducted in conjunction with the Holstein-Friesian Association of America, and the authorities of the International Live Stock Exposition for cows entered in competition in the "Farmers' Cow Contest." All the tests are conducted under stringent rules adopted by our Station which are intended to render them absolutely reliable and beyond suspicion of deception.

During the past month we have conducted tests of pure bred cows in the herds of the following breeders of Guernsey cattle:

	No. of cows tested.
Geo. C. Hill & Son, Rosendale, Wis	5 cows
Fred Vogel, Jr., Milwaukee, Wis	5 "
Ben Clark, Whitewater, Wis	7 "
M. D. Cunningham, Kansasville, Wis	5 "
Remington & Son, Elk Mound, Wis.	1 "

In addition, five cows have been tested in Mr. Scribner's herd, making a total of 27 Guernsey or Jersey cows tested by us during the past month. The number is apt to vary somewhat from month to month, as some cows will be added to the list and others taken off, from the fact that they either freshen or are being dried off. In case of these tests the breeders keep the weights of milk produced and the feed consumed by the cows, the results of the tests being used for obtaining the average quality of the milk for each cow during the month and as a check on the weights of milk reported by the owners. In these one-day tests one of our Station representatives comes unannounced once a month to the respective farms and tests the cows for a full day, for either two or three milkings.

The greatest call for men to conduct seven or thirty-day official tests of Holstein cows comes during the winter months when most of the cows freshen and when the conditions surrounding the cows are under better control of the breeder than at any other time during the year. Applications for these tests are, therefore, only beginning to come in. Five tests have been conducted by us for the following Holstein breeders since October 1st: F. B. Fargo, Lake Mills, Wis.; E. E. Randall, Watertown, Wis.; August Seefeldt, Hochheim, Wis.; McGeoch Estate, Milwaukee, Wis.; S. B. Jones & Son, Watertown, Wis., and Rust Bros., of West Allis, Wis. The latter three tests are in progress at this writing. In addition, applications for tests to begin in the near future have been received from W. H. Jones, Watertown, M. H. Gardner, Darien, and Frank Brewster, Bowers, Wis.

It will not be necessary to describe in this place the manner of conducting official tests adopted by us or to give the rules governing these. This information is given in our annual reports and will also be found in a bulletin to be published in the near future by our Station. A full account of the official tests conducted by us during the year ending October 1st, 1903, will be given in this bulletin.

F. W. WOLL.
Wisconsin Experiment Station.

In a Nutshell.

A Vermont subscriber to the DAIRYMAN in renewing his subscription sums up the case as follows:

"It is worth a good deal more than a dollar a year to me to associate in thought and practice with the best dairymen of the country—such as, for instance, read HOARD'S DAIRYMAN. I like good society and you can't get it for nothing. It is a great thing to provide one's self with the right kind of stimulant.

AN INSTANT'S PAIN and the dehorning job is smoothly done, no crushing or bruising if the

The World's Year's Butter Fat Record Broken.

The above is the title of a printed slip sent us by Mr. Wm. H. Caldwell, Secretary of the American Guernsey Cattle Club, and with it was the cut from which the accompanying illustration is printed. We quite agree with Mr. Caldwell that the record which follows is "certainly a credit to the cow and her owner, and to the careful management which Mr. Hope has given her."

Further comment would be superfluous, but it may be neither out of place nor out of season, to call attention to the fact that this remarkable dairy cow has the rising "pelvic arch," the "incurving thigh" and the "high arching flank," as well as the large middle piece and other outward indications which usually distinguish the good dairy cow, of whatever breed she may chance to be.

The Senior editor had the pleasure of visiting Mr. Twombly's herd last spring and made a special study of this cow, with the result that he was prepared to expect great things of her.

Following is the history, decription and record of this cow as sent us by Mr. Caldwell:

Charmante of the Gron, No. 14442, was imported by Mr. H. McK. Twombly in 1901 from the herd of Mr. E. A. Hambro of Kent, England. She was dropped July 7, 1896, and is registered on the Island as 3944 P. S., R. G. A. S. Her sire is His Magesty 952 P. S., R. G. A. S., and her dam was Charmante 5th. 2619 P. S., R. G. A. S., known in England as MaCharmante 4890 E. G. H. B. She was bred by Mr. J. Bourgaize, Gron, St. Savior's, Guernsey. Charmante of the Gron is a very well marked cow, of good dairy conformation, with excellent udder, and a great credit to the breed and to Mr. Twombly's choice herd. She dropped a bull calf Oct. 6, 1902, and he is developing into an animal of much promise and is known as Florham King No. 8401.

Her year's record began Oct. 11th, 1902, and the requirements for her admission to The Advanced Register were 10,000 lbs. milk; 360 lbs. butter fat. The results of her year's work are as follows:

IMP. CHARMANTE of the GRON.

MONTH.	*Lbs. milk.*	*Per cent butter fat.*	*Lbs. butter fat.*
Oct. 11-31	693.56	4.9	33.98
Nov.	1194.94	5.3	63.33
Dec.	1142.25	5.4	61.68
Jan.	1121.06	6.1	68.38
Feb.	1019.25	5.7	58.10
March	1108.50	5.6	62.08
April	997.40	6.0	59.84
May	1078.20	6.2	66.85
June	1013.00	5.6	56.72
July	864.85	5.7	49.30
Aug	769.45	5.7	43.86
Sept	710.25	6.0	42.62
Oct 1-10	162.05	6.0	9.72
Total	11874.76	5.7 Av.	676.46

This record was supervised in connection with the New Jersey Agricultural Experiment Station. Not only does the work of the year greatly exceed the requirements of the Register, but it is the best year's record of a cow of any breed in the world, where public supervision has been given same. It is equivalent to 789.2 pounds of butter, or an average of 2.16 pounds butter a day.

Mr. Jos. L. Hope, the able superintendent of Mr. Twombley's Florham Farms, gives the following data as to the feed consumed by the cow during the year.

	lbs.
Bran	1,726
Gluten	833
Cotton Seed Meal	160
Linseed Meal	134
Corn Meal	58
Middlings	58
Total	2,969

Or 8 lbs. a day.

For roughage she had corn ensilage, beets or mangels, and mixed hay in winter. In summer, in addition to pasturage, she had in season, oats and peas, green clover, alfalfa and corn fodder.

This record is certainly a credit to the cow and her owner, and to the careful management which Mr. Hope has given her.

Dairy Questions Answered by Prof. Farrington.

TESTING AND PAYING FOR FARM SEPARATOR CREAM.

In handling cream from patrons who skim their own milk with a hand separator, does not a patron lose something by sharing equally with the other patrons who bring milk to the factory?

In testing cream do you use more acid than 17 c. c.? I find the fat always remains white and not the natural color we get in testing milk when using the ordinary quantity of acid.

What is the average per cent of overrun from cream?

Would a man be safe in paying the Elgin price for butter fat in cream and expect to make a commission of three cents per pound on the butter churned every day? C. H.
Waunakee, Wis.

In order to justly pay cream patrons at a factory where milk is received, it is necessary to make some provision for the fat which is retained at home in the skim milk. The milk patrons are paid for the total amount of fat in the milk which they deliver to the factory. The skim milk from this whole milk is returned to them, and this skim milk usually contains somewhere near .1 of one per cent fat. The milk patrons are paid for the fat in the skim milk, because they are paid by the weight and test of the whole milk which they deliver to the factory. You must, therefore, in order to pay the cream patrons on the same basis as the milk patrons, make some provisions for calculating the amount due him for fat in the milk from which his cream is skimmed. Such an adjustment can be made by increasing the cream fat by the amount left in the skim milk at home. The fat in the skim milk can be fairly estimated to be about three per cent of the total fat in the whole milk. This does not mean that the skim milk tests 3.0 per cent but means that the skim milk tests .12 per cent fat, and when the whole milk tests 4.0 per cent this .12 is just 3.0 per cent of the 4.0 per cent, If you pay your cream patrons on this basis your account with them will be something like the following:

Patron A delivers 320 pounds of cream testing 20 per cent fat; multiplying the weight of cream by the test gives 64 lbs. fat delivered to the factory. If now we add the fat left in the skim milk, we multiply this 64 pounds by 1.03 which gives 65.9, which is very nearly the amount of fat in the milk from which this cream was skimmed. You will therefore pay this cream patron on the same basis as your milk patron if you use this 65.9 in calculating his dividends the same way as you use the weight of fat delivered by each milk patron in calculating their dividends.

This method of paying cream patrons has proved to be very satisfactory and I think it gives them their just dues when both milk and cream are received at the same factory.

COLOR OF FAT IN CREAM TESTS.

The reason why your cream test did not turn so dark colored as the milk test is because you did not let the cream test bottle stand long enough after mixing the acid with it. The difference in color is caused by the unusual amount of fat which the cream contained as compared with the fat in the milk. The cream tests will turn dark and the fat which separates in the neck of the bottle will be dark colored if you will allow the cream test bottle to stand 15 minutes at least after you have thoroughly mixed the cream and acid in the bottle. You can accomplish the same thing by setting the cream test bottles in water having a temperature of about 100°, then thoroughly shake the test bottle and you will find that the mixture will turn dark in the same way as you have noticed milk to act and that the fat which separates will be a deep yellow color like that obtained when testing milk.

The variation in the color of the fat which separates in the test bottle is caused by the intensity of the action of the acid on the fat. This action is increased by elevating the temperature or by allowing a longer time for the action of the acid on the cream than you ordinarily do in testing milk.

CREAM OVERRUN.

The overrun of butter from cream is about 18.0 per cent. This is some three per cent more than the overrun calculated from milk. You will understand that the reason for this is found in the fact that the fat which has been left in the skim milk does not come into the overrun when you are calculating it from cream. My answer to your first question in regard to paying for cream should help to explain the difference in overrun also.

PRICE TO PAY FOR CREAM.

Whether or not you can afford to pay the Elgin price for cream fat will depend a great deal on the amount of cream you receive. If your factory is located in a place where it can be economically operated and you have no unusual expenses and not much money invested in the building or equipment, I think you ought to be able to make a fair profit by paying the Elgin price for butter fat in cream. It will probably cost as much to run the factory when you churn one hundred pounds of butter per day as if you churn five hundred; that is, the wages of your buttermaker, the amount of fuel used, etc., will be nearly the same in both cases. About the only difference will be in the amount of supplies necessary for handling the five hundred pounds as compared with one hundred. You will need more butter packages, also more salt and color, but if your commission for making is three cents, as it usually will be if you get your commission from the overrun, this three cents per pound on one hundred pounds of butter made per day will amount to $3, while on five hundred pounds, it is $15 per day. You will see then, that you must determine for yourself whether or not you can afford to make butter for this price. It depends largely on the amount of butter made each day.

LOSSES AT THE CHEESE FACTORY.

"I would be very thankful for information in regard to cheese making where the factory is run by test. Will milk that tests 4.0 per cent make more cheese than that which tests 3.0 per cent? If it does ought there to be a thick coating of butter fat on the whey tank every morn-

ing? I have been told that there is a working loss which cannot be avoided but do not think this loss ought to be enough to form a thick coat on the whey tank.

Is it a fair deal to all the patrons to run a cheese factory by test, if there is a waste of butter fat? There is some dissatisfaction among our patrons, those having low tests are complaining and some of those furnishing milk with a high test think that they are getting a little more money than belongs to them.

Our cheese maker told us in the early part of the season that a variation of two-tenths of one per cent fat in the milk between the highest and lowest test of thirty-two patrons would show us that something was wrong. He has had so much as nine-tentes of one per cent difference in the test of milk from different patrons but he has not found anything wrong that I know of.

Is there any way to find out the amount of curd that 100 weight of milk contains, or does all milk have the same amount of curd in it?

How much does a machine cost that will show whether or not milk has been watered? Can such a machine be used by a cheese maker that has not had experience in that line of work?"

Mineral Point, Wis. H. E. DAVIS.

It has been shown by careful experiments that the amount of cheese which may be made from milk will increase as the richness of the milk increases. A study of the yield of cheese from many factories has been made and a comparison of these results with the tests of milk in different factories has shown that as a rule one pound of butter fat in milk is equivalent to about 2.6 pounds of cheese. You can therefore get a very fair idea of the amount of cheese which any lot of milk will produce by first testing the milk and then multiplying the pounds of fat by 2.6. According to this rule 100 pounds of milk which tests 3.0 per cent fat will make about 7.8 pounds cheese and 100 pounds milk testing 4.0 will make about 10.4 pounds of cheese.

There is no doubt whatever about the test of milk being a fair and reasonable measure of the cheese value of milk, and in factories where it is used the patrons are as well satisfied that they are receiving their full measure of the money received from the cheese when they are paid by the test as are the patrons of creameries where the Babcock test is used.

Fat in the Whey.

The amount of fat left in whey is influenced many times by the cheese maker. If the curd is agitated excessively in the vat this will have a tendency to thresh out a certain amount of fat which will be lost in the whey. This is one reason why in Swiss cheese making the factories find it profitable to make whey butter. The Swiss cheese maker stirs his curd in the kettle excessively and by so doing separates a great deal of the fat from the milk. This is taken from the curd and carried into the whey. When the whey is allowed to stand the fat rises on the surface and is skimmed off and made into what is called "whey butter."

In Cheddar cheese making the whey, under favorable conditions, ought not to test much over three-tenths of one per cent fat. A cheese maker who understands his work, if he receives good milk, ought to be able to keep the test of the whey down to this point. If more than this is lost there is some good reason for it. When there is an excessive loss of fat in the whey I do not see why all the patrons should not suffer from this loss. I cannot conceive of a good reason for confining it to certain patrons whose milk tests differently than others. Those bringing rich milk to the factory certainly should not complain, as the rich milk will make more cheese than thin milk. I think it is not probable that they receive more than belongs to them if the testing is accurately done.

The quality of the cheese will improve with the richness of the milk and this is another reason why the Babcock test is the proper thing to use in determining how much each patron should be paid at a cheese factory.

Variations in Tests.

The statements made concerning the variation in test of milk from different patrons at a factory, is a new one to me. I do not think it is possible to find a factory which is supplied by twenty or more patrons in which the milk of the different patrons does not vary more than two-tenths of one per cent. The test of different lots of milk will vary as much as one per cent in nearly all factories; it is not uncommon that milk testing 3.5 and 4.5 per cent fat is received at the same factory. I should be inclined to be more suspicious of a uniform test of the milk from many patrons than of tests that vary from one to two per cent between extremes.

Your question in regard to the amount of curd one hundred weight of milk contains, I have already answered in the first part of this letter in which I stated that the approximate value of curd (cheese) in the milk may be estimated by multiplying the pounds of fat by 2.6.

The detection of the addition of water to milk is not done with a machine designed for that purpose, but the Babcock test and a lactometer may be used to examine suspected milk. The standard in Wisconsin for legal milk is 3.0 per cent fat, and when milk containing less than this is found it should be investigated further by following it to the cows which produced it. In some cases normal milk will test below 3.0 per cent fat, but as a rule the average cow of Wisconsin will give milk testing near 4.0 per cent fat. If you have good cause to be suspicious that milk is being watered you should refer the case to the Dairy and Food Commissoner, Mr. J. Q. Emery, State Capitol, Madison, Wis.

Twenty-five Cent Butter During the Entire Year.

"The farmers here have a cheese factory but on account of poor management they have not made a success of it. This last summer it has been used as a skimming station for an outside creamery. The farmers are dissatisfied with prices and with tests, which they have received this summer. Two men are here representing creamery companies and they are working the farmers. They propose to build a new creamery and guarantee 25 cents a pound for the butter the first year. They want at least fifty farmers to buy one share of $100 each. Then the creamery will cost at least $4440. Can you recommend this company? We shall probably get the milk from 500 cows within four miles of the factory."

Canton, Wis. O A.

I have recently given some suggestions in regard to starting a creamery, in an article in this paper, and I think you will find it of interest and valuable to read that article. Probably you can get copies enough of the paper to send one to each of the farmers interested in your creamery.

The amount mentioned in your letter, of $100.00 each from fifty farmers, is rather a large sum for investment in a creamery. I think you can start the enterprise for less money than this and do it in a satisfactory way.

The number of cows mentioned ought to make a first-class creamery, and if you have canvassed the territory and know that this number are within four miles of the factory, you will undoubtedly have a successful business.

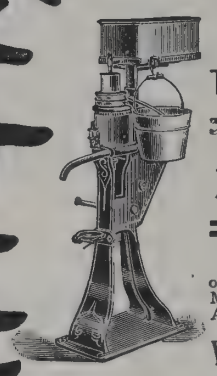
I think you will be benefitted by sending some of your number who are particularly interested in the enterprise, to visit a few successful co-operative creameries at other towns of the state. By so doing you can get a good idea of what it costs to erect a creamery in that town and the dimensions of rooms, as well as the equipment that has been satisfactory to them. I certainly would advise you to do this before accepting the proposition to raise $5,000.00 and hand it over to any company to build a factory for you.

The price mentioned, of 25 cents a pound for butter during the entire year, is an absurd one for any one to make with the expectation of living up to it. The price of butter varies during the different months of the year, and it is impossible for any one to predict what the average price of butter will be in the future. If you are guaranteed 25 cents a pound for butter, the only way you can put any dependence on such a statement, is to have the party making the guarantey place several thousand dollars in a bank and agree to forfeit it in case your creamery does not receive this price per pound for its butter during the entire year. I would not advise you to let such a statement receive the slightest consideration, but start your factory with the expectation of selling your butter at the best price possible during the entire year. You cannot expect to receive much above the market price, but you ought to get that, whatever it is.

If the farmers will unite and give the management of the creamery to some one of their number who is broad minded and businesslike, I am sure that a creamery in your neighborhood will be a paying investment for you all.

Rape: Its Value, Use and Culture.

[Press Bulletin.]



Every year the question of cheap summer forage becomes more and more pressing. To the farmer whose pasture lands are of limited area, the use of some crop capable of producing the maximum yield of the most nutritious forage is imperative. Various crops have been tried, and it is not my aim to condemn any, but rather to bring one valuable plant to your consideration and solicit for it a trial.

The crop I mean is rape. It ranks as one of the most nutritious of our forage plants. It is remarkable not only for

the valuable character of the food it supplies, but also for the large amount that may be produced on a given area. It will yield two or three cuttings in the season, and the amount harvested off an acre may vary from 25 to 35 tons in the summer.

The quality of the feed produced is most excellent. Analysis shows it to be richer than clover in flesh-forming material. Feeding operations prove it to be particularly well suited for beef cattle, young stock, sheep, lambs and swine. It may be used as a pasture, and this fact rendess it all the more valuable to the busy farmer.

SOIL AND SEASON.

It will grow on almost any kind of soil. It will give a fair return off poor land. It will yield a heavy crop on average soil. It will produce an immense amount of food on very rich land. It does well on dry soil, it thrives and grows apace on moist places. It will grow on good land, no matter how dry the season, if sown in rows and cultivated. It will flourish in the most rainy weather if water does not stand in the field. Stubble or fallow should be used; sod is not suitable.

SEEDING AND CULTIVATION.

If intended for pasture, it is usually best to sow broadcast at the rate of 3 lbs. per acre. The exception is, when pigs are to be pastured, for experience has shown us that it is better under such conditions to sow in rows 21 to 24 inches apart. The space between the rows may be cultivated once or twice till the plants are well under way.

The pigs may usually be turned in 5 or 6 weeks after seeding, and an acre will carry from 25 to 40 during the season. It is better to divide the field into 2 parts and change pastures at intervals. It will be found necessary to limit the meal ration, if the most profitable results are to be looked for.

Steers do well on it at any time, but it is probably of the greatest value for beef production in the autumn. Lambs and sheep like it and do well on it at any season, but they must not be confined to rape exclusively, and care must be exercised to prevent their bloating on it. They should not be turned in when hungry, nor when the rape is wet with rain or dew. The same precaution applies to steers or young cattle.

J. H. GRISDALE.

Central Experimental Farm, Ottawa, Canada.

A West Virginia Silo.

ED. HOARD'S DAIRYMAN:—We have just finished our ensilage. I filled two silos 10×12×30 ft. high, which I believe will hold about 80 tons each. I will hold one for summer.

The construction of the silos is the most simple of any I ever heard or read of. I just took No. 1 white pine flooring 14 and 16 ft. long for siding, then used 2×12 hemlock, 12 and 14 ft. long for hoops. I then painted the inside with tar and benzine paint. I made this myself. I can buy the tar for 10 cents per gallon, then use the benzine for thinning it. I then lined the inside with 2-ply tar paper; just tacked it enough to hold it until the ensilage came against it. This makes a complete air-tight silo and one which will last forever inside. These silos cost me complete, not including my own time, $140.63.

We are now milking 20 cows, receiving on an average about 400 pounds milk daily. Cows in all stages of lactation.

The crops in this section were poor this season, owing to the continued drouth, and feed is higher than ever, and many are discouraged, selling their cows, and as they term it, "quit going in debt in winter just to crawl out in summer."

I have been dairying for seven years and have the first winter, including the months from October to April, to go in debt, or in other words, not to realize a profit. I do not keep a registered herd either, but just a herd of grade Jerseys and Holsteins of my own choosing. I do not keep a daily record of my cows, that is, by weighing each milking, but I keep a pretty close eye on the milk pail. When there is an uncalled-for decrease I go to work to investigate. If it proves to be the cow the butcher has the chance to speculate. W. S.

Wheeling, W. Va.

Renovated Butter

Can you tell me how renovated butter is made?
Willink, N. Y. B. J. C.

Renovated butter is made by first melting the butter and filtering the fat from the water and impurities. The liquid fat is treated with air to remove the material that gives the butter its off flavor. It is then churned with milk and worked and salted as usual. There are many minor points which each manufacturer considers essential to success, but they can only be known by practical work in a renovated butter factory.

Program of Indiana Dairymen's Association.

The following program is announced for the 14th Annual Convention of the Indiana State Dairy Association, to be held at Plymouth, Ind., December 10th and 11th, 1903.

Building up of Dairy Herd and Business - - - - - - Mrs. Charles Lamont
The Dairy Barn - - - W. J. Rippey
Why I have Turned Dairyman H. F. McMahan
Feeding the Dairy Herd - D. B. Johnson
The Results of Creamery Patrons Investigation in Marshall Co., Ind. - - -

A noted Wisconsin dairyman and writer, will visit fifty farms, noting number and kind of cows kept, feed used, and results secured and present a full report of the yield of milk and cost of production for one year.

Thursday, at 5:30 p.m., a banquet will be served. The first prize butter and cheese will be served. Professor H. H. Dean, of the Ontario Agricultural College, will speak on some phase of Canadian Dairying.

Development of the City Milk Business - - - I. O. Johnson, Grand Rapids, Mich.
The Troubles of the City Milk man - - - - - - - I. B. Calvin
Hand Separator from the Creameryman's Point of View - - - - W. V. Clifford
How I Ripen Cream - C. F. Hostetter
Starters. Their Value and Use - - - - - H. M. Slater, Purdue University
Pasteurized Cream and Butter - - - - - Prof. H. H. Dean, Canada
Reading of Prize essays on cost of Producing Milk and Butter.
Demonstration Butter Scoring - - - Prof. H. E. VanNorman and H. M. Slater.

The awarding of a handsome silver cup to maker of highest scoring entry of creamery butter, dairy butter, and cheese made in Indiana.

PRIZES.

Silver cups valued at $25 to $30, will be awarded to the maker of the highest scoring entry of creamery butter, dairy butter and cheese.

A pro rata fund will be divided among those scoring 90 or over, except that if the winners of the cups are not present when awarded, they will not share in the pro rata fund.

Entries from outside of the state may share in the pro rata fund. For entry blanks and rules, address Secretary, H. E. VanNorman, LaFayette, Indiana.

H. E. VanNorman, Sec.
Purdue University.

Book on Pota'o Culture.

Do you know of any book published regarding potato raising, as I wish to raise a large number next year. M. L. C.
Manchester, Iowa.

The only special book on this subject that we now recall in a work entitled, The New Potato Culture. Send to the Rural New-Yorker, 409 Pearl St., New York, for price.

"ADVERTISEMENT."

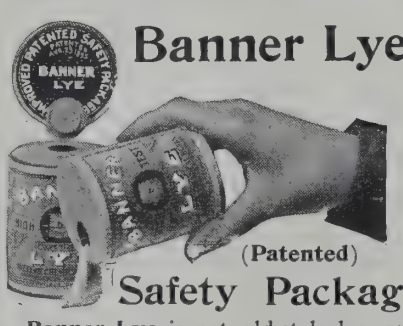
HAPPY DAYS

When Friends Say "How Well You Look."

What happy days are those when all our friends say "How well you look."

We can bring those days by a little care in the selection of food just as this young man did.

"I had suffered from dyspepsia for three years and last summer was so bad I was unable to attend school," he says: "I was very thin and my appetite at times was poor while again it was craving. I was dizzy and my food always used to ferment instead of digesting. Crossness, unhappiness and nervousness were very prominent symptoms.



"Late in the summer I went to visit a sister and there I saw and used Grape-Nuts. I had heard of this famous food before but never was interested enough to try it, for I never knew how really good it was. But when I came home we used Grape-Nuts in our household all the time and I soon began to note changes in my health. I improved steadily and am now strong and well in every way and am back at school able to get my lessons with ease and pleasure and can remember them too, for the improvement in my mental power is very noticeable and I get good marks in my studies which always seemed difficult before.

"I have no more of the bad symptoms given above but feel fine and strong and happy and it is mighty pleasant to hear my friends say: 'How well you look.'" Name given by Postum Co., Battle Creek, Mich.

Look in each package for a copy of the famous little book, "The Road to Wellville."

WILL IT PAY YOU TO TAKE HOARD'S DAIRYMAN?

W. H. Jenkins took a census in 1901 of 50 farmers who were patrons of the creamery in Montrose, Pa. Twenty-five of them read dairy papers; twenty-five did not. The twenty-five who did read dairy papers averaged $50.23 per cow for the year. The twenty-five who did not read averaged $32.95. Here is a difference of $17.28 per cow. Did it pay the twenty-five to read? Did it pay the other twenty-five not to read? That's not all. Those who did read averaged a profit over cost of food of $15.06 per cow. Those who did not read averaged a profit of 66 cents. Is not that dairy farmer standing greatly in his own light who will not pay 2 cents a week for Hoard's Dairyman? These are hard facts worth thinking over.

COMING EVENTS.

COMPARATIVE VALUE OF THE DAIRY INDUSTRY.

H. R. Wright in his address before the Dairy and Food Commissioners at their recent meeting in St. Paul, quoted the following figures. Speaking of the dairy industry he said:

"Its product with a value of $590,000,000 is greater than the annual value of hogs sold in the United States, $500,000,000; it is greater than the value of all the hay and forage, $484,256,846; it is greater than the value of all the meat cattle slaughtered, $419,455,200; it is greater than the value of all the wheat produced, $369,945,320; it is greater than the value of all the eggs and poultry, $281,178,035, and it has a value almost twice as much as the value of oats, $217,098,584; sheep, $50,000,000; barley, $40,631,762; rye, $12,290,540; rice, $8,000,000, and buckwheat, $5,747,853. It far surpasses the value of cotton, $330,000,000, and is second only to the value of corn produced, $828,258,326."

SOILING COWS.

Every year we see the necessity of furnishing the cows with extra feed, from the latter part of July, even if the pasture is good. This necessity is made evident by the never failing shrinkage in milk and the fact that when the cows are afforded a good feed twice a day either of bran, ground feed or some succulent feed in the form of a soiling crop, they respond by a profitable increase of milk. The amount of the profit is governed of course by the price of butter and the quality of the cow. But the thing we wish to speak of is what is the most efficient and economical way to furnish this extra soiling food? Most farmers provide it in the way of green corn, peas, or some other green crop. This involves much extra labor and care. The cheapest and most profitable method we have ever employed is the summer silo.

Although the pastures in this part of Wisconsin have never been finer or more abundant than this year, yet the milk shrinkage came as of old, but not quite so pronounced as in ordinary dry seasons. About three weeks since, we opened the silo and have been feeding the cows ensilage night and morning, with a light sprinkling of dried malt sprouts and cheap molasses, which we purchased in Milwaukee at $15 a ton. The effect of such soiling was seen at once and we find it profitable. In no form can we soil our cows as efficiently and cheaply as by the use of good ensilage made from field corn. It is right at hand and convenient to feed, and we venture the assertion that no dairy farmer will ever employ any other method when once he has given this a fair trial.

THE SCIENCE OF MAKING HAY.

Some man, we cannot exactly remember who, once said:

"So far as I can see all there is to this thing we call science as applied to farming, consists in knowing *why* and seeing *how* best to do things."

That is a good definition. First learn *why* things are as they are; next the best *how* to do them.

There is always a big chance to improve in our methods of doing farm work. That is the *how* of it

The past season has been a very trying one for the making of hay, particularly in the middle west, owing to the great excess of rain. An immense amount of hay has been practically rendered worthless in feeding value by repeated wettings. Somehow the average farmer does not seem to take kindly to the idea of considering the cotton hay cap as a part of his indispensable machinery. HOARD'S DAIRYMAN has said more on this subject, than all the agricultural journals in the United States, yet but very few of its readers have adopted its advice. Like all other new ideas this grows very slowly into the conviction of the farmer.

Yet, just the difference of a yard and a quarter of muslin, multiplied a thousand times, has made with us the present season, the difference between good rich hay and a very much damaged article.

The hay cap made from good A sheeting, 40 inches square, will cost, weights and all, about 12 cents. Several ruling reasons call for its adoption and general use.

To have its highest feeding value hay must be cut at the right stage of growth, when it contains sufficient juice or succulence. If cut at this stage it is more difficult to cure by the ordinary open air method. For this reason farmers lose all sight of feeding value and looking only to ease and certainty of curing in the windrow, let their grass stand until it has lost most of its milk making value.

A complete reorganization of hay making methods should be had, based upon the scientific *why*. The object should be to get the best food in the best condition possible. If we obey this demand we must change our ideas.

1. We must give up the almost worthless timothy and raise the clovers, which are the red, alsike and alfalfa.

2. We must cut these clovers just as they commence to blossom, before the seed forms, when they are full of juice, in their best stage.

3. We must cure these clovers not in the windrow, thereby losing the leaves very greatly, and drying it too intensely in the sunlight, but in the cock where it will go through a sweating process—cured in the shade so to speak.

4. To do this successfully, we must add to our method the covering of the hay cocks with hay caps to prevent wetting and too rapid evaporation of moisture.

Hay cut and cured after this method, has nearly double the milk making value to what it has, cut when farmers generally cut it and cured in the windrow.

This method is particularly helpful in wet seasons like the present one.

THE SILO, AS IT APPEARS TO A MAN WHO USES IT.

The hard work that is required to convince so many farmers of the great value and economy of the silo, has always been a wonder to us. The silo is no new thing. It is 30 years ago since the first attempt was made in that direction in Wisconsin and since that time the spectacle of farmers who have silos and those who would not have them anyway, can be seen in the same neighborhood all over the West. Mr. H. D. Chapman, an experienced dairy farmer of Amherst, Mass. in writing a business letter to the DAIRYMAN says:

Some of the articles and inquiries in regard to the silo which appear in the DAIRYMAN seem a little behind the times, as seventy-five per cent of the farmers of this part of the country have them. I have two 12x16x21 feet that I put in ten years ago. I have filled them with different kinds of corn; have filled them fast and slow; have kept men treading it down some years, and some years run in a large pile and then leveled off. I always get about the same returns at the milk pail. After all I have learned or not learned, I would hesitate to advertise to tell all about the silo or how to fill one. One man may do it one way and get satisfactory results and another fill it some other way and be equally satisfied with his results.

The above reminds us that what men are *satisfied* with doing is in reality not a safe criterion for them or others to go by.

Many a man has been satisfied to milk a cow that is running him in debt every year, but the thing to enquire about, is has he a right to be satisfied?

Every dairy farmer needs knowledge, the best he can get, so he may know whether or not he is satisfied in doing his work in too expensive and inefficient a manner.

NEW ENGLAND AS A DAIRY SECTION OF THE UNITED STATES.

There are fifty-nine thousand, two hundred and ninety-nine farms in the state of Maine. Of this number seventeen thousand, seven hundred and forty are principally devoted to dairy products. In other words, a little less than twenty-nine per cent of the farms of Maine are devoted to dairying. Vermont has a little over fifty per cent of her farms devoted to dairying; Massachusetts, a little over thirty-six per cent; New Hampshire a little more than thirty-three per cent; Connecticut, with a fraction over thirty per cent, and Rhode Island, with twenty-six per cent.

The above interesting deduction taken, no doubt, from the census of 1901, we take from the address of Hon. W. C. Philbrook before the last session of the Maine State Dairymen's Association at Waterville.

Mr. Philbrook makes the statement that the reason why some of the New England states exceed Maine in extent of dairy production, is because of the "proxmity of their farms to many and excellent markets, and the ease with which those markets may be reached."

This reason is hardly satisfactory, for if it was, it ought to obtain as strongly in Iowa, Wisconsin and Minnesota, where the dairy product is largely shipped to and consumed on the Atlantic Coast and in the south.

To our mind there is a deeper and more universal reason and it is this: Wherever on this broad continent, from Canada to Georgia and from Maine to California, the farmers have been led to think, read and take an interest in dairy problems, right there has occurred a correlation or organization of their mental and material forces for the promotion of their dairy welfare. Out of this mental attitude has come dairy prosperity, even in sections remote from markets. Without dairying does not prosper, even if contiguous to good markets. There can be no doubt of the advantage of good markets or the farther advantage of cheap and quick transportation. But these are not the primary forces that solve the problem. It is just as true in dairying as it is in law, that success is dependent on the amount of mental comprehension that is brought to bear on the question. It is brains that tell. If the states of Maine or Wisconsin are not prospering as they ought in dairy farming, it is because their farmers are not bestowing the necessary amount of brain work on the question. Mix more brains, more mental interest, more study, more comprehension with the labor of the hands, and there will result at once a great increase of profitable production.

Farther along in the proceedings of the convention occurred the address of Mr. J. A. Roberts of Norway, under the title "Snap Shots at Maine Dairying." He hit the nail squarely on the head, as to the causes of dairy advancement in that, or indeed any other, state when he said:

"Through an *increased knowledge* of the principles of breeding and feeding and through more careful handling of the cow and her product has come the real advance of the dairy interest in this state, and that, in my opinion, is in the right direction."

Fourteen years ago we gave an address before the Maine dairymen on "The Dairy Temperament in Cattle." Some of the ideas we advanced at that time were vigorously combatted. Since that time we have visited the state in the same capacity several times, and each time we could see the marked advance of ideas and their result in improved practice. Some day we believe Maine will be hard to beat as a dairy state, for her agricultural brain is thoughtful and alive.

AN EXCELLENT DAIRY BOOK.

With the compliments of the author, Prof. H H. Dean of the Ontario Agricultural College, comes a neatly printed little volume of 260 pages, entitled "Canadian Dairying." We have given it a somewhat hasty examination and we are especially pleased with it in every particular. It is somewhat risky to make a book on dairying, for the reason that the methods, and general understanding of this question are in such a rapid state of change.

But Prof. Dean has succeeded admirably in presenting the whole of this dairy proposition from the farm and all the problems there involved, to the cheese factory and the creamery, in language at once simple and comprehensive This is a most valuable feature for the plain farmer who has not at his command a knowledge of scientific and technical terms.

The book is written from the Canadian standpoint and that makes it all right for the dairymen of the United States. As soon as proper arrangements can be made we hope to be able to supply the readers of HOARD'S DAIRYMAN with this latest, as well as most excellent, addition to the literature of dairying.

The Hired Man Again.

ED. HOARD'S DAIRYMAN:—Your editorial, "The Hired Man Question," interested me much. I am a hired man, or manager, just as you please. I have read the pros and cons on this subject in the agricultural press for years, but have failed to find anyone mention what I think to be the key to the problem. It is

this, the bringing together of like ideas. If a farmer has old fogy ideas, he must have a hired man of old fogy ideas. A farmer who believes in reading agricultural papers, the silo, rotation of crops, special purpose cows, etc., doesn't want a hired man like the above. I know if I were looking for a new position, I should like to find a man with ideas of farming the same as mine. Employer and employe must study each other's human nature, and try to please each other, especially employe.

I have worked around for years (four years in present place) and I find that it pays to please the man you are working for. Many hired men don't care, and they never get the best wages or the best places, nor will they make the best farmers when they get to working for themselves. The best farm hands of to-day will be the best farmers of to-morrow. Give the farm hand a word of encouragement, talk over farm affairs with him. Give him good farm papers to read, for the more he knows the better it will be for you.

I could say more, but don't want to take your time longer. I believe you are doing a good work. I wish you a long life, and success to the DAIRYMAN.

Windsor, Conn. M. H.

Note and Comment.

Succulent Food and Milk Fever—Corn for Roughage—An Open Fall and Poor Feed—Rye Pasture—Balanced Ration—Green Corn and Fruit in November.

HOARD'S DAIRYMAN asks about succulent feed, and milk fever, and the experiences of its readers who are feeding silage, and all about it in three questions. So far as the undersigned is interested, he will say that this is the eighteenth year we have fed silage to our dairy, and some of the cows have eaten silage for over ten years, and since silage and grass have formed the roughage crop for the year, we have never had a case of milk fever, though before that we could not say as much. Of course the cows now all drop their calves in the fall, some in Dec., but they are in fine flesh and by tradition have a right to have fever. Possibly this has a bearing on the matter, no grain is fed while the cows are resting and she is grassed all she will eat, and then green corn fodder is given in small quantites, with the ears snapped off. Be sure that the cow's bowels are normal at least. I have now and then given a cow a good feed of cut potatoes to loosen her up before dropping her calf, which may explain things.

Right along this same subject is that of cow buyers who buy springers by the hundreds every year, from the Ohio river to the Illinois line; ship them here, sort, grade, bunch and make ready for buyers, who may want one cow, or take five car loads. These cows run in abundant pastures, have no grain or care, and the lot may be flecked with little calves by spells, and in all these years I have never known one of these cows to have the milk fever. I asked a big buyer why? "Oh" said he, "we give 'em natural conditions, let nature dictate in the matter is all there is to it I guess." Is the above in line with the reasoning of Dr. Pearson?

I think the season of 1903 has demonstrated in Northern Ohio, that the corn crop. as a sure reliance for the great roughage feeding crop, has no equal. From the start until almost September, everything seemed to conspire against the crop, Too dry to get rapid germination, then too wet, too cold nights, too cloudy, cold days, the moon signs were all unfavorable, and weeds grew at all hours and refused to be killed with any sort of tool. Then came the September days. How the corn did grow and reach up; the ears came out in surprising numbers and developed into lusty annexes.

Corn that had been kept clean of weeds and trash, especially the silage crop, made phenomenal growth. The October weather helped the soft corn, hardened it up, and the field corn became a No. 1 yielder, and I never put more well developed ears of corn into the silo to the number of stalks, than this year. "Yes, the frost held off," says one, which is only to say that the corn crop is a greater certainty than the frost. So it's the story everywhere. The corn crop manages to pull through every year, for the man who tries to raise a crop, and helps, in a generous way, the fellow who is always saying "'tan't goin' t' be a corn year nohow."

I do not remember of any such perplexing condition of affairs in connection with late fall milk making, as exists now. The warmest, open fall ever known, bright, warm days, and traces of frosts in the morning, no rains to keep the fall feed brightened up, the succulence dried out both of the rank pasture feed, and the soiling crops; cows refusing to eat grass, and too languid to eat dry winter foods, even the finest of September cut clover rowen fails in tempting them to eat a full meal; far too warm to venture on silo feeding and those who did, got no increased yields, but when that commences, good-bye stores of nice fodder, and soiling crops just out of the green.

Well, the result has been, that the fresh cows shrank a fourth or more. Even so good a dairyman as Geo. Scott failed to keep up the messes of his cows; use "dairy straws" as he would, and even tearing his hair, and throwing dust upon himself would not stay the shrinking yields. Early in September, we put in two fields to rye with the expectation of plowing the crop under next spring for corn sod. The crop had grown up luxuriant, and the ground being very firm through lack of late rains, brought out the suggestion that it might be a good thing to turn the milkers in there an hour morning and night and with the effect of getting an increase of milk, and with it came a firm cow resolve to eschew the late grazing grounds, and stand squarely by the new 20th century dairying. As oats makes a pretty nearly frost resisting crop, why should it not be a pretty good thing to sow a few acres of combination, oat, barley and rye for late October grazing.

This fall it has been a problem what to do with the cows. They neither wanted to go afield, nor would they stay in yard, or stable, without lifting up their voices in dumb (?) protest, but this rye lot so far has stilled the concert, and fills the pails more nearly, and that is the objective point in all dairying.

The time was not so very long ago, when if Harry Hayward had said what is credited to him on page 852 about balanced rations, and that other conditions being equal, a ration any where between the limits of 1:4 and 1:12 made as much milk, and fat, as a strictly balanced ration, he would have been taken out and guillotined with a dull blade; but as it is, he is promoted and made assistant Chief of the Dairy Division at Washington. This gives the advocates of home grown grains for the dairy quite a friend at court, and makes us fellows who have "figured out rations" at the institute, and retailed a "heap of wisdom" sing quite small, to hear that some protein is as good as more, and that an excess of it passes off without apparent effect upon the cow, and did not have a stimulative effect upon the milk organs, nor was it held in reserve for future use.

Is this a surrender to the hard headed old farmer who has forged right ahead, feeding corn meal, oats and wheat shorts mixed, pound for pound, and said if his cows got a variety of foods, they were all right in milk producing. Haecker of Minnesota is strong in his belief that the smaller feeding of protein gives as satisfactory results, and Jordan of New York has a doctrine that he has been known to make public to the effect that that when proteins are high, feed some other feeds or combinations of feeds. It looks to me as if the cows on this clay farm would be told that too much protein was not good for them, and to make up their minds to get ear corn, ground with oats, and a third weight of fine bran with a trace of oil meal in it, and to get into a state of mind to believe from the start, that it is the best grain ration in the world,

It would be interesting too, to say the least, if we could now know what the ration makers will hang out on the bulletin board in 1910, as the latest demonstrated, best combination of feeds for a dairy cow. I wonder if we will not see before so very long, notices of slightly damaged and a trifle shelf worn books for sale very cheap, about how to feed and develop the dairy heifer, to make room for new editions, a summary of the latest and most exact data by the Professor of Dairying of Exploit College. With protein knocked out, dual-purpose cows boomed in the bulletins, and cheese cured by gentle freezing, it is pretty hard to tell with exactness what HOARD'S DAIRYMAN has been published for since 1886!

On the 5th of November a series of events and coincidences, somewhat intermingled with the natural, occurred on our farm that made the day to be marked as somewhat out of ordinary. During the day, swarms of snowflakes filled the air, but melted before reaching the ground, though at dark the fall was quite heavy for a half hour. That day the garden gave us, fresh from unfrosted stalks, some of the finest green corn for dinner. The red raspberry bushes gave us a showing of ripe fruit, and the golden queen raspberries gave us a presentable showing for dinner, of the largest, plumpest and fine-flavored berries of the year, and a visit to the strawberry patch gave us perfect blossoms and some large but not ripe berries. Some pretty wild violets are to be found along the wood edges, and strange, in all of this plenty of berries, there is scarcely a bird to be seen or heard. This is not strictly a dairy item, but it does show that it is better to live in the country and milk cows, than to go to the city and be a lamb when the steel stocks are being shorn.

Ohio. JOHN GOULD.

Succulent Feed and Milk Fever.

ED. HOARD'S DAIRYMAN:—In answer to your inquiries in your most valued paper of October 23, I would say: Have been dairying for 14 years. Have never lost a cow with milk fever. Am keeping 20 cows at present, with of course a smaller beginning. Have no silo yet, but feed roots. In all these years I hardly ever fed grain to cows; it is too high priced here. To dry cows I feed only a small amount of roots, but about a week before calving I give full ration viz 30 to 35 pounds a day. I raise mangel wurtzel, carrots and rutabagas and mix them. Roots yield 40 tons to the acre with me, on well manured bottom land. Have some most excellent cows (grade Guernseys.) Have one cow a (scrub) that gave for a time 9 gallons of milk a day, but have another that beats her badly on the long run. C. H. W.

Arlington, Wash.

INQUIRIES AND ANSWERS.

Every inquiry must be signed with the name, Post-office and state of writer. Condence the questions into plain epecific inquiry. Be careful to note if your questions eave not been answered in replies to others. We are glad to answer all the pertinent questions that we can concerning machinery. Look over our advertising columns and write to the advertisers.

A California Feeding Problem.

Will you please give me a balanced ration for my 10 cows weighing 800 to 1,100 lbs., from the following feeds: Bran, $23; ground barley, $23; ground rye, $26; mill feed (bran and middlings), $24; alfalfa hay, $10. I have not much alfalfa, but have some mixed with good barley straw, and some grain hay and plenty of good barley straw and some green alfalfa pasture, but the pasture is getting short. The cows are at present on the pasture and allowed to have all of the straw they will eat and 5 lbs. bran and 2 lbs. rye per day. No hay, thought best to save the hay until cold weather. Will it pay to buy hay at $10 a ton? Butter at 30 cents; separate our own milk, and creamery wagon calls for the cream and charges 2 cents per lb. for manufacturing and selling, and we receive the balance. Cows averaged over $6.00 for the month of September. What ought a cow to make per month to justify milking? My cows are mixed breeds. I want a ration to get the most butter for the least amount of money. C. M.

Ceres, Cal.

It is of course quite impracticable to give a ration formula in which a mixture of alfalfa with barley straw in unknown proportions or grain hay is the main roughage. The best we can do is to submit suggestions as to what in our judgment would be a good average ration, and leave it to our correspondent to make such modifications as his environment may demand. Alfalfa hay, at the price named, is much the cheapest feed mentioned. A ton of it, if of good quality, is almost as valuable as a ton of bran.

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrient.		
		Protein.	Carbohydrates	Ether Extract
12 lbs. alfalfa hay	10.99	1.32	4.75	.14
10 lbs. barley straw	8.58	.07	4.12	.06
6 lb. ground barley	5.35	.52	3.94	.10
Totals	24.92	1.91	12.81	.30

If any of the cows seem to demand it and can make profitable returns, one might add a small amount of bran to the above.

Relative Feeding Value of Cotton Seed and its Products.

Please give me the relative feed value of whole cotton seed, raw and cooked, compared to cotton seed meal, W. W. C.

Lavonia, Ga.

There have been no very satisfactory experiments along these lines. Feeding a cow for 30 days with one combination of feed stuffs, then changing to some other combination for 30 days, and then changing again, as one would change fuel under a steam boiler, fails to take into consideration the important factor that the cow is not, like the steam boiler, an inanimate machine, composed of but few parts and simple in construction, but is, on the contrary, of very complex anatomy, the different parts so interdependent and miraculously compensatory, that one cannot say what effect the feed of today may have 10 or 20 days hence. For example, we know that by some mysterious process of metabolism, the cow can draw upon her own body for material out of which to make milk. It is common speech that the dairy cow milks down in weight, and it is one of the tricks of the trade to test cows as soon as possible after freshening when they are drawing not alone on the feed eaten, but from their own surplus fat and flesh as well, for the casein, the fat and the sugar afterwards found in their milk.

Hence, as we have said above, short periods of feeding do not furnish very satisfactory data for estimating the relative feeding value of different feed stuffs. There have been several of these short time experiments with cotton seed, both cooked and raw, and cotton seed meal, and the preponderance of the testimony thus secured, indicates that the boiled seed is slightly better than raw seed, and that raw seed at six dollars per ton is cheaper than the meal at 20 dollars per ton, but how much cheaper is not stated. From the figures given we are of the opinion that the raw seed may be worth at least half as much as the meal, and that for dairy purposes the boiled seed is to be preferred to raw seed, as less liable to impart injurious flavor to the product.

For Rhode Island Holsteins.

Mr. A. F. LeG., of Greene, R. I., although a reader of HOARD'S DAIRYMAN for a long time, has only recently joined the ranks of active dairymen. He has now 15 grade Holstein cows and has purchased a registered bull from Stevens Bros., Lacona, N. Y. Feed is scarce and dear. Corn meal sells at $22.50; gluten feed, $26; hominy, $23; cotton seed meal, $28; mixed feed, $23; bran, $22; barley sprouts, $18. For roughage, he has silage (from immature corn) enough to allow 20 lbs. per day; red top and timothy hay, and also a few tons of oat hay. His cows weigh from 700 to 1,000 lbs., and are in all stages of lactation, and he asks us to submit a ration formula to suit the conditions named.

There should be nearly as much variation in the feed given these cows as there is in the quantity of milk they yield, or, if fresh, are capable of yielding. After providing the feed of maintenance, the amount above this should be strictly apportioned according to the present ability of each cow to respond. With 20 lbs. of silage and 12 to 15 lbs. of hay, 4 lbs. of malt sprouts, 2 lbs. gluten feed, and 2 lbs. corn meal, fed half at night and half in the morning, with a teaspoonful of salt each time, should suffice for cows giving 30 lbs. of milk. If any cow is capable of giving more than this amount of milk daily let her have more gluten feed; and for cows giving less than 20 lbs., reduce the allowance of grain proportionately.

A Vermont Ration.

Please give the best balanced ration for profitable feeding of cows of medium size from the following feeds:

Good mixed hay worth $10 per ton; corn silage (some with ears, some without); bran, $21.50; cotton seed meal, $28; corn meal, $23; mixed feed, (wheat product), $22.50.

Am mixing 100 lbs. bran, 100 lbs. corn meal and 50 lbs. cotton seed meal. If you will kindly publish a formula of right proportions and quantity to each cow you will confer a favor on a reader of your valuable paper. B. H. M.

West Burke, Vt.

If the "mixed feed" is equal to a feed with similar name reported in Bulletin 81 of the Vermont Experiment Station, we should favor substituting it for corn meal, but otherwise the combination named is as good as any we can suggest. If the cows are fresh in milk or nearly so they ought to make profitable use of 6 to 8 lbs. of this mixture, besides having all the hay and silage they will eat without waste. Good hay that is worth $10 per ton is too valuable a product to be fed lavishly. It is always well to feed so sparingly that the edge of appetite will not be dulled. A teaspoonful of salt night and morning on the feed is not only an appetizer, but it aids digestion and assimilation. Also, if at all practicable, feed the grain in connection with the silage.

What Should Be the Price of Butter to Patrons of a Creaemry?

There is a problem which is causing considerable discussion in this locality and would like your opinion. The question is this: When the Creamery Co. charges the patrons the average price of butter for the month for what butter the patrons draw out for their own use, does the patron pay for the making twice. Enclosed find monthly statement which explains matters more fully. F. H. C.
Hudsonville, Mich.

Certainly the patron does not pay twice for the making. It makes no difference to whom the butter is sold, whether it be a patron or a stranger, the price should be the same. If a patron may draw out fifteen pounds of butter for his own use at a price 2½ cents (the charge at this creamery for making) below the average price of sales, what is to hinder him from drawing out 500 pounds, or all that his milk makes, be the same more or less? Or suppose a man takes the milk of only one cow and has the butter from it made for his own use. The creamery sells all the butter it makes and collects full price for it. Then it pays the patron for his milk, and it is immaterial whether it pays in cash or in butter at the average price. It is just the same as it was with the old-fashioned grist mill, where toll was taken for grinding, or if it was matter that the miller did not want to "toll" cash was paid.

A New York Ration.

Please formulate me a ration for 900-lb. cows, fresh last April and not to be fresh again under a year. I have good mixed clover (red and aliske) to feed noon and night all they will eat up, and low land hay for morning feed. Bran is $1.00 per cwt.; cotton seed meal, $1.40; corn meal, $1.20; rye, $1.10; oil meal, $1.60. Your good paper is very much appreciated. E. J. H.
Dormansville, N. Y.

The proper feeding of these cows will depend very much whether they have been allowed to shrink over much in milk flow. One cannot expect to increase the flow very much now, and the amount to be fed must be graduated by the results obtained. When the cow begins to increase perceptibly in live weight the indications are that she is being fed more than is profitable, or is not receiving proper milk-making feed. It is much to be regretted in this case that there is no silage or roots to give these cows. The next best thing is oil meal, and notwithstanding its excessive cost, we believe it would pay to use at least a pound a day for each cow, possibly more, but of this only a person in daily contact with the cows can judge. For the balance of the grain part of the ration, we recommend equal parts by weight of bran and corn, and if these cows make good use of 4 lbs. of this mixture daily, it is about all that could be expected.

Snap Shots at Maine Dairying.

J. A. ROBERTS, Norway, at Maine Dairymen's Association.

I am a thorough believer in the cow, and I think I ought to be, because she has been a good friend to me. As we look at the condition of dairying in the state of Maine today, as compared with its condition a few years ago, I think we may safely say that while there has been a fairly satisfactory advance in the number of dairy animals kept upon our farms, the real advance we have made is in the keeping of the animals and the feeding of them in such a way as to secure an increased product. Our farmers have learned that the cow of moderate ability when fed only rough fodders from the farm, may become a tolerably fair cow when fed a properly balanced ration. Many cows in our state, that under poor feeding have been unprofitable cows, under a good system of feeding become profitable cows. Through an increased knowledge of the principles of breeding and feeding, and through a more careful handling of the cow and her product, has come the real advance of the dairy interest in this state, and that, in my opinion, is in the right direction. If it is desirable for us to increase the number of our dairy animals, it is still more desirable to make those which we have more profitable than they are at present.

The dairyman finds some difficulties in the way; his pathway is not perfectly smooth. Today his greatest difficulty is in the labor question, and I am fearful that unless that is solved many of us will be obliged to curtail our operations in the future, because it seems to become harder and harder every year to find men who are fitted for this work and willing to engage in it. Those of us who get our living by the care of the cow know that we must give to the business our constant attention, not only six days in the week, but seven, and from early morning until late at night. We have to look closely after the details of the business in order to make it successful, and we are finding it difficult to get men who will assist us in this work, and do it as it ought to be done. It seems to me that this labor question is one of the difficulties that stand in the way of the progress of dairying in the state of Maine.

There is another difficulty which is not a new one, and which I understand this Dairymen's Association is trying to remove. I think we might divide the dairymen into two classes. Possibly we could not draw a distinct line between them, but I would say this: There are men engaged in dairying who make a specialty of it, and from the very fact that they do make a specialty of it, they study the principles that underlie it, and they look about for the best practices. These men are usually successful. There is another class of men who engage in dairying, in connection with other lines of farming, in only a small way, and in a careless and indifferent manner. These men are to be found everywhere. There are more of them than I wish there were. Some of them you will hear talking about this business and they will say that dairying does not pay. Some of them put it a little broader and say farming does not pay. Do you know what I should say to those men? I should say to them, why are you in that business if it does not pay? Haven't you mistaken your calling? When you say that the dairy business does not pay with you, or that farming does not pay with you, is it not a commentary on your own judgment in going into this business? I believe that dairying does pay, and that farming does pay, and furthermore, there are proofs of it in every town in this state. It is only necessary for us to have faith in the business and put our soul into it, and our life into it, the way business men who succeed in their business do, in order to make farming one of the most profitable in the state. Those men who do a little dairying and do it in a slipshod manner, milking cows at one hour one day, and at another hour another day, feeding them irregularly and without any system, and who do not keep them clean, are the men that stand in the way of the progress of dairying in this state, because in some cases they are keeping down the price of the product.

Under the old system of private dairying, which is in vogue to a certain extent to-day, the man who made poor butter received his reward and the man who made good butter, got a good price and received his reward. But in the creameries, as I understand it, all cream, the good, the bad and indifferent, is pooled together, and the man who has poor cream, who is not careful in his business, gets just as good a price as the man who furnishes good cream. I think this is a difficulty that we must overcome. How are we going to do it? President Alden, in his ad-

DO YOU GET UP WITH A LAME BACK?

Have You Uric Acid, Rheumatism or Bladder Trouble?

Pain or dull ache in the back is unmistakable evidence of kidney trouble. It is Nature's timely warning to show you that the track of health is not clear.

If these danger signals are unheeded, more serious results are sure to follow; Bright's disease which is the worst form of kidney trouble may steal upon you.

The mild and the extraordinary effect of the world-famous kidney and bladder remedy, Dr. Kilmer's Swamp-Root, is soon realized. It stands the highest for its wonderful cures of the most distressing cases. A trial will convince anyone—and you may have a sample bottle free, by mail.

Swamp-Root Entirely Cured Me

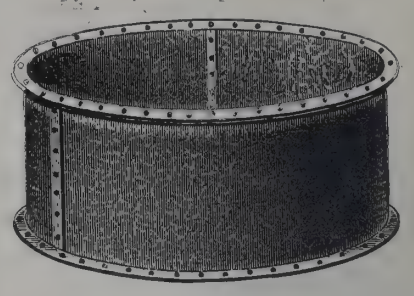
Among the many famous cures of Swamp-Root advertised by HOARD'S DAIRYMAN, the one we publish this week for the benefit of our readers, speaks in the highest terms of the wonderful curative properties of this great kidney remedy.

GENTLEMEN:—I know you do not need this from me as you are daily receiving hundreds of testimonials. However, I want to say that I think you have the greatest remedy on earth for kidney, bladder and liver trouble. I had been troubled for years, was operated on several times and spent a large amount of money and received no benefit whatever. I suffered everything and it was necessary for me to get up as many as twenty times during the night. I gave Swamp-Root a thorough trial and it completely cured me. J. W. ARMANTRAUT, Sept. 12th, 1903. Greentown, Ind.

Lame back is only one symptom of kidney trouble—one of many. Other symptoms showing that you need Swamp-Root are, obliged to pass water often during the day and to get up many times at night, inability to hold your urine, smarting or irritation in passing, brick-dust or sediment in the urine, catarrh of the bladder, uric acid, constant headache, dizziness, sleeplessness, nervousness, irregular heart-beating, rheumatism, bloating, irritability, wornout feeling, lack of ambition, loss of flesh, sallow complexion.

If your water when allowed to remain undisturbed in a glass or bottle for twenty-four hours, forms a sediment or settling, or has a cloudy appearance, it is evidence that your kidneys and bladder need immediate attention.

In taking Swamp-Root you afford natural help to Nature, for Swamp-Root is the most perfect healer and gentle aid to the kidneys that is known to medical science.



Swamp-Root is the great discovery of Dr. Kilmer, the eminent kidney and bladder specialist. Hospitals use it with wonderful success in both slight and severe cases. Doctors recommend it to their patients and use it in their own families, because they recognize in Swamp-Root the greatest and most successful remedy.

To Prove What SWAMP-ROOT, the Great Kidney, Liver and Bladder Remedy, will do for YOU, Every Reader of Hoard's Dairyman May Have a Sample Bottle Absolutely Free by Mail.

If you have the slightest symptoms of kidney or bladder trouble, or if there is a trace of it in your family history, send at once to Dr. Kilmer & Co., Binghamton, N. Y., who will gladly send you free by mail, immediately, without cost to you, a sample bottle of Swamp-Root and a book of wonderful Swamp-Root testimonials. Be sure to say that you read this generous offer in the Fort Atkinson HOARD'S DAIRYMAN.

If you are already convinced that Swamp-Root is what you need, you can purchase the regular fifty-cent and one-dollar size bottles at the drug stores everywhere. Don't make any mistake, but remember the name, Swamp-Root, Dr. Kilmer's Swamp-Root, and the address, Binghamton, N. Y., on every bottle.

Make the Farm Pay

There's money in farming if you understand modern methods and farm intelligently as taught by our correspondence course in
Modern Agriculture.
Under Prof. Wm. P. Brooks, Ph. D., of Mass. Agricultural College. Treats of soils, tillage, drainage, fertilizers, crop rotation, stock-feeding, poultry-raising, dairying, etc. Also Horticulture under Prof. Bailey, of Cornell University, and Agricultural Bacteriology under Prof. Conn, of Wesleyan.
Full Commercial, Normal and Academic departments. Tuition nominal. Text books free to our students. Catalogue and particulars free. Write to-day.
THE HOME CORRESPONDENCE SCHOOL,
Dept. 55 Springfield, Mass.

dress this morning, told us that it would be along educational lines. Education is sometimes slow, but if it is in the right direction it usually reaches the end in view. But how are we to educate our people along this line? Of course we have meetings like this, we have farmers' institutes, which are a great educational factors, and there are courses in dairying at the University of Maine where boys and young men, and old men too, if they desire to go there, may learn the principles that underlie this noble occupation of ours, and also learn the best practices of the dairy. I believe it would pay to send our boys and our young men there. If I were a young man to-day, going upon a farm, knowing what I do about the business—and I have spent nearly all my life on a farm—I would take a two years' course in the Agricultural College, fit myself for some one or two specialties, and then I would go upon the farm and I would develop the farm. I believe that I could enjoy myself as well in doing that as in any other business, and that I would not have to labor any harder, and at all times in my life I would be in an independent position.

There is one thing that our farmers need in order to be successful dairymen. They must have enthusiasm; they must be fired by ambition. If a man has no ambition to do a little better next year than he is doing this year, to keep a better cow and make her product into better butter or better cream, then he will not be successful. But the man who is determined that as the years go by his knowledge shall increase and his practices improve, will surely be successful in the end. At the University in this state, and I think in nearly all the states in this country, all farming states, at least, there are short courses in agriculture, where young men and young women can learn dairying and orcharding and other lines of farming. My friends, it makes me feel sad to find that the boys of New England are not taking these courses. Turn to the record of the western states, and especially those great northwestern states, and we find that the young men and young women are flocking by hundreds to the short courses at the universities. They are spending a few months in the study of the business in which they are engaged, and coming back to the farm not only with increased knowledge, but with an inspiration that has been given to them from coming in contact with men who have a broader conception of the business in which they are engaged. Now I heartily wish that you would send your boys up to Orono. Send them to these short courses, this winter, and give them an opportunity to study this subject. It will be to your advantage as well as theirs.

Starting a Dairy Herd.

A correspondent in *Ohio Farmer*, in giving his experience in starting a dairy herd, says:

"At first sight it looks easy. All a man has to do is to fill his pockets with money and start out. The world is full of cows. Why should we find it difficult to buy a dairy that will fill the bill? And so, when I was thinking just what should be the heading for this article, I said to myself, 'Starting a Dairy' is all right. But it came into my mind soon after that starting and trying to start are sometimes two entirely different things.

"For instance, a chapter from my own experience has some things quite interesting about it. The first cows I ever owned (that was going on fifteen years ago), I bought. Part of them were fairly good. One was recommended to me as being perfectly gentle and a nice milker. Before she had been in the stable two days she proved the strength of her hind legs by kicking the cows either side of her out of reach every time she had a chance. The same kind of practice she began with me when I began to milk her. A rope or strap about her body, 'just in front of her bag,' as we often hear quoted, would not make the slightest difference with her. If she could do nothing else she would lean over against me so hard that I would be pushed from the stool. This got to be quite monotonous after a time, and still that cow was a good milker. She gave good milk and a nice mess of it. I worried along with her for several years, raising a number of heifer calves from her. For days at a time she would be as peaceable as a kitten, then she would let her heels fly like lightning. Every one of that cow's calves had a tendency to kick. And they had leg muscles like iron when they had a mind to use them. Finally I determined to weed every one of the breed out, and I did it. Life is too short to spend it fighting a cow. I never will try it again.

"Then, in the course of my buying, I came into possession of a cow which was subject to garget. She had it regularly every season, and I came to the conclusion that it was so far chronic that I could do nothing for her. I doctored her as faithfully as I knew how and all to no purpose. The strangest part of it is, some of the calves I raised from her had the same failing. Will some of our wise men tell us why?

"So it went on for some years and I did not seem to be getting much nearer to my desired good dairy. Then I tried buying calves of men who seemed to have good stock. This is, in my opinion, all right if one can buy of reliable men. It sometimes seems as if the men who can be called strictly honest about selling cows are quite scarce and hard to find. It is not difficult for men to remember all the good points of a cow and forget the bad ones. But there is not the same temptation about selling young calves. The owner will almost always take you into the stable and show you the father and mother of the calf you have taken a fancy to, and tell you just what the mother has done in the way of giving milk and plenty of it. So there is not nearly as much risk in buying calves as there is in purchasing cows. And yet one often gets poor cows that way, in spite of his best efforts at feeding liberally and with a view of getting a good, all around cow.

"And so I found that buying calves is not really the best way of starting a herd. And I tried buying the best bull calf I could find and putting him with my cows, varying this now and then by using the best stock my neighbors had. A farmer who has an eye on the future can make no greater mistake than to mate his cows with any kind of a sire that happens to be handy. If he does not keep a bull of his own, it is often a big job to take his cows away, and he gets careless about it and says: 'Well, this year will not make much difference.' But it is a year and the years count after a while, especially when one gets to be 50.

"And I believe this is the true way to build up a herd of dairy cows. We can not be sure what we are getting if we buy mature cows; neither is the practice of buying calves entirely free from objections. But when we raise our own calves from the best possible parentage that lies within our power we are on the right road. True, we will sometimes make mistakes by following this plan. Some of the poorest cows I ever had came from what I looked upon as good parents. It is a wonderfully interesting study to see how animals will 'take back' now and then in color, size, and other qualities."

"ADVERTISEMENT."

HARD ARGUMENTS

Coffee Uses Them Whether One Likes or Not

The ill effects of coffee are present in many coffee drinkers but some people pay no attention to the warning signals like dyspepsia, insomnia, nervousness, fluttering of the heart, etc., until coffee finally uses a knock down argument which means collapse on the part of the coffee drinker.

"I am 30 years old and have drank coffee since I can remember until four years ago when I broke down completely with nervous prostration and indigestion. I simply cannot describe the agony I suffered.

"Doctor told me he could not help me if I did not leave coffee alone so I bought some Postum to give it a trial. At first I did not know how to make it and was disappointed in the taste, but after reading the directions on the package carefully, made it right, and then I thought it better than coffee. At that time I weighed 140 pounds and now I weigh 185 pounds, that's quite a gain isn't it? I never have indigestion now and the headaches are all gone and I am otherwise entirely well and strong.

"I never had any troubles that were not due to drinking coffee and these disappeared and health came in their place when I shut off coffee and drank Postum." Name given by Postum Co., Battle Creek, Mich.

Saving of Seed Corn.

Press Bulletin.

There is nothing of more importance to the farmers throughout the corn belt of the United States than the quality of seed corn. The Bureau of Plant Industry of the United States Department of Agriculture, states that in the northern part of this area special precautions are always necessary in saving seed on account of the short seasons and the consequent difficulty in getting seed which is fully matured. In a season like the present these conditions hold good over a larger area than usual.

Most of the corn is in the field at the present time, and if not immature, it at least contains a large percentage of moisture. If this moist corn is left in its present condition until after cold weather the freezing will kill a large part of the seed and the planting of this poor seed will mean a thin stand next year.

Where the seed corn has not already been obtained, it should be selected at once. Pick out only thoroughly matured ears, or if none can be found that are thoroughly matured, take the ripest to be had. Husk and put in a dry, well-ventilated place kept at a temperature of from 75 to 100 degrees Fahrenheit and let them remain there until the seed is thoroughly dried and cured. After it has been dried it should be stored where it will remain reasonably dry and cool. It is only when the seed contains a large pecentage of moisture that the germination is injured by freezing. If a little trouble is taken now in selecting and caring for next year's seed, the stand and the consequent yield will be greatly increased.

In all cases seed should be tested for germination a short time before planting, and only such seed planted as is found to be in the best condition. Seed tests can be made easily and often more conveniently at home, but the Seed Laboratory of the United States Department of Agriculture, so far as its working force will allow, is prepared to make tests for corn growers without charge.

IMPORTANT POINTS TO BE OBSERVED.

1. Select fully matured seed ,or at least the ripest that can be obtained.
2. Bring the corn from the field before freezing weather and keep it in a warm, dry place, with ample ventilation, until thoroughly dried.
3. Store in a dry, cool place.
4. Test for germination before planting.

Paraffined Cheese.

From the New York Agricultural Experiment Station, at Geneva, N. Y., comes the following report of tests made with paraffine coating as a protection for cheese:

"By paraffining the cheeses much of the loss in weight was prevented, especially at the highest temperature, and the quality was improved in some instances —never lowered.

"Half the cheeses in one lot were dipped in melted paraffine when a few days old and were distributed in the curing rooms at different temperatnres, to compare with the other half of the cheeses, which were untreated. The operation of paraffining, which is a very simple and inexpensive one, leaves each cheese coated with a thin layer, almost air-tight and water-tight, of a material upon which mold will not grow. Evaporation is thus checked and the cheeses are kept free from mold.

"The difference in the scores of paraffined and unparaffined cheeses was slight up to twenty-eight weeks, with the cheeses kept at 40°, and up to twenty weeks with those cured at 50°; but at 35 weeks with the 40° cheeses and at twenty-eight weeks with those kept at 50°, there was an average difference of one point on the score in favor of those paraffined. At 60° there was an average difference, when the cheeses were twenty weeks old, of one and one-half points in favor of paraffining.

"When covered with paraffine, the cheese cured at 40 degrees lost only 0.3 lbs. per 100 lbs., those cured at 50 degrees lost only 0.5 lb., and those cured at 60 degrees lost only 1.4 lbs. In the same kind of cheese not thus covered the loss was much greater at all temperatures. By covering cheese with paraffine a saving in loss of moisture can be effected amounted to 5 or 6 lbs. per 100 lbs. of cheese at 60° Fahrenheit, and at 50° or below, the total loss of moisture, can be reduced to less than 1 lb. per 100 lbs. of cheese.

"At 40°, the difference in favor of the paraffined cheese, counting both quality and quantity, was 51 cents for 100 lbs. of cheese stored; at 50° the difference is 63 cents, and at 60° $1.11. The saving is much greater at higher than at lower temperatures.

If we compare an unparaffined cheese, cured at 60°, with a paraffined cheese cured at 40 degrees—which would represent the maximum of influence under the conditions of the experiment—we find a difference of $1.76 per 100 lbs., or 1¾ cents a pound, in favor of paraffining and low temperature.

"Briefly summarized, the advantages of curing cheese at low temperatures are the following:

"1. The loss of moisture is less at low temperatures, and therefore there is more cheese to sell.

"2 The commercial quality of cheese cured at a low temperatures is better and this results in giving the cheese a higher market value.

3. Cheese can be held a long time at low temperatures without impairment of quality.

"4 By utilizing the combination of paraffining cheese and curing it at low temperatures, the greater economy can be effected."

Ayrshire Breeders' Association.

ED. HOARD'S DAIRYMAN:—The Twenty-ninth annual meeting of the Ayrshire Breeders' Association will be held in the parlor of Stanwix Hall, Albany, N. Y., Wednesday, Dec. 2, 1903, at 10 o'clock a. m., business meeting, to hear reports of secretary, treasurer and standing committees on Home Dairy Test, St. Louis Dairy Test, and the Ring Show at St. Louis, and for the election of officers.

AFTERNOON SESSION.

At 2 p. m. there will be an address of welcome by Hon. Charles A. Wieting, New York State Commissioner of Agriculture.

Response by the President.

An address will be given by Rev. Elmer F. Pember, Bangor, Maine, Subject: "The Ayrshire, the Best Cow for the New England Farmer."

A paper will be read by C. M. Winslow, Brandon, Vt., Subject: "The Relation of Structure to Dairy Capacity."

All interested in the breeding of Ayrshires are invited to attend this meeting.

Discussion will follow each paper.

There will be a banquet in the evening, given by the Association to which all members of the Association are invited.

A meeting of the Executive Committee will be held in the parlor at 8 o'clock Tuesday evening.

GEO. H. YEATON, Pres., Dover, N. H,
C. M. WINSLOW, Sec'y, Brandon, Vt.

What He Finds in the Dairyman.

Mr. Clark H. Carmer, of Middleport, N. Y., drops us a line and says:

"While I am not engaged in dairying, yet I find a great many things in HOARD'S DAIRYMAN that are a help to me and I expect to build up a good herd sometime. When I commenced farming five years ago I knew nothing of the business and I feel I do not know enough at this time to get along without the help of such papers as the DAIRYMAN, the *Rural New Yorker*, and others I take.

Heifer Twin with Bull.

An inquiry comes to us from Georgia, as to whether a heifer born a twin with a bull will prove barren. Usually such heifers will notbreed, they are technically called "free martins" and the following is copied from the Century Dictionary:

Free-martin. A cow- calf twin- born with a bull-calf. It is generally barren, and when this is the case, on dissection it is found to have parts of the organs of each sex, but neither perfect.

The bull calf in such a case is usually a normal animal.

ILLUSTRATION

THE KALAMAZOO PLAN

We desire to call the especial attention of every reader of Hoard's Dairyman to the offer made in this issue by the Kalamazoo Stove Company of Kalamazoo, Mich, manufacturers of stoves and ranges, selling direct from the factory to the user at factory prices. Their proposition is this: They guarantee to save you from 25 to 40 per cent in price. They guarantee that you cannot get a better stove or range anywhere at any price. They prepay the freight. They will send you a stove or range on 30 days trial and then leave it with you 360 days on approval. If you are not perfectly satisfied, return the stove, at their expense and get your money back. All stoves are blacked, polished and ready for setting up. Their guarantee is backed by a $20,000 bank bond. The company is composed of some of the best known business men in the state of Michigan—men with ample resources to fulfill every promise they make. They are able to sell their goods at low prices simply because they are the only REAL manufacturers who sell direct to the user, thus eliminating all middlemen's, agent's and dealer's profits. They have a factory which is not excelled in equipment by any stove factory in the world, and their line of goods is as near perfection as skill and care can produce from the best materials in the markets afford. The Kalamazoo line includes ranges, oak heaters, wood burners, etc., in a variety of sizes. We show herewith one of their handsome ranges and their oak heater. A special feature of their cook stoves and ranges is the Kalamazoo oven thermometer which shows the temperature of the oven without opening the door, enabling the

cook to keep perfect control of her baking and roasting at all times. If you have a house to keep warm or a meal to cook, it will pay you well to send to the Kalamazoo Stove Company, Kalamazoo, Michigan, for Catalogue No. 163 and special prices (freight prepaid) on their famous line of stoves and ranges. They will treat you right.

WATERTOWN, N. Y., Nov. 7—Cheese—Sales, 5,000; 10½@10⅝c for large; 10¾ for small; 10½ for Twins.

NEW YORK MARKET.

NEW YORK, Nov. 7—Butter—Receipts for the week, 25,621 packages. Exports for the week, 1,493 packages.
Our market was about a repetition of last week. Fancy fresh goods were a very small proportion of the receipts and high scoring extras were hard to find, yet price was no higher, and was inclined to be weak at the close.
Every wholesaler and retailer who has any summer butter in freezers has been pushing it, with the result that the extremely light arrivals of strictly fancy butter have been enough to go around without advance in last week's prices.
Under grades fresh Creamery were plentiful and sold at 20@22c. New York State Dairy of fine quality is wanted and would sell close up with best creamery, but there is little of this kind arriving, most of the receipts being ordinary and poor and sell at 14@18c. Freezer creameries of extreme fancy quality have had some inquiry at 21½@22c, while all other grades were neglected. Imitations and Ladles and Renovated butters are dull at lower and irregular prices. We quote:
Creamery, fresh extra, 22½c; medium, 20@22c; poor, 13@19c; creamery, freezer, extra, 22c; medium, 19@21c; poor, 16@18c. Dairy, extra, 21@22c; medium, 19@20c; poor, 14@16c.
Cheese—Receipts for the week, 22,030 boxes. Exports for the week, 4,760 boxes.
Our market is extremely dull for all grades of cheese; finest September makes sold in small parcels at 11¾@11⅞c, and Octobers sold at 11@11¼c.
Skimmed cheese were more plentiful; fancy light skims sold at 9@10c, and under grades sold at 3@5c, and were hard to sell at that. We quote:
Full cream, extra, 11½@11⅞c; medium, 10@11¼c;poor, 7@9c.
Eggs—Receipts for the week, 38,941 cases.
New laid stock keeps very scarce and prices have steadily advanced until 30c has been paid for best marks and some exceptionally fancy lots have sold for more money. Market closes firm for all good sweet eggs. We quote:
New York & Pennsylvania, best, marks, per doz., 29@30c; Northern & Western, best, marks, 28c; all sections, poor to fine, 20@26c; refrigerator poor to fine, 18@23c.
177 Chambers St. DAVID W. LEWIS & Co.

BALTIMORE MARKET.

BALTIMORE, Nov. 5.—Butter—With continued light receipts of stock suitable for table purposes, business has moved along quite satisfactorily. Since our last report, notwithstanding the fact that extra creamery is in very light supply, there seems to be very little disposition to speculate. Dealers are keeping their purchases of the current receipts confined to actual needs, and are filling in the crevices with storage butter whenever a favorable opportunity presents itself. Imitations and ladles of desirable quality are quite scarce; all choice to fancy offerings meet quick sale. Rolls—Some few lots have been coming, and have met ready sale, particularly when in good condition. Packing stock—The supply, though moderate, is about, equal to the requirements. Prints and blocks of desirable quality are in good request. At the close of to-day's market the feeling was reasonably firm, but with the continued advance of prices there is a very close discrimination of quality.
Creamery separator, extras,23@23½c: firsts,21½@22½c; seconds,19@21c: creamery blocks(2 lbs.), extras, 24c; firsts, 22½@23½c; seconds, 20@22c; do prints, (½ lbs.), extra, 25c; first, 23½@24½c; seconds, 20@22c; Md. Va. & Penna. prints, extras, 24c; firsts, 22@23c; seconds, 18@20c.
Eggs—Soon after our issue last week, with quite a shrinkage in the receipts of strictly fancy stock and very good demand, the prices quoted at that time were exceeded; but so far this week, with a less urgent demand and quite an increase in the receipts, the market presents an easier appearance at 28 cents, and lower prices may be looked for at no distant day. Choice to fancy storage stock is moving out fairly well at 21½@22c.
301 Exchange Place. G. M. LAMB & BROS.

SAN FRANCISCO MARKET.

SAN FRANCISCO, Nov. 7—The demand for the better grades of butter lacked the vim that characterized Monday's trading, but as general offerings were light the market continued on a steady basis and supplies of the favored brands of creamery were well absorbed at full figures. The cheap lines of butter continued to drag slowly, despite holders' urging and their willingness to accept shaded prices. In storage goods, firm prices prevailed and a fair movement was in progress. The situation in the market for eggs was without change. Receipts were well cared for and selected Ranch were freely marketed at the top quotations, the maximum figure being an outside price for small lots of extra large whites. Storage eggs were steady at former prices. There was a fair call for cheese and the quoted rates were maintained with a marked degree of steadiness.
Receipts yesterday aggregated 13,900 pounds butter, 833 cases eggs and 13,700 pounds cheese.
Butter—Creamery, extras, 30@31c; good to fancy. 26@29c; dairy. extras, 24@25c; dairy, choice, 22@23c; store, 18@20c; California storage, 24@27c; eastern creamery, 23@25c.
Cheese—California creamery, mild new, extra, 14@15c; mild, new, choice, 13½@14c; Young America, 14@15½c; eastern, New York, Cream, Cheddars and Flats, new, 14½@16c.
Eggs—Ranch, selected large, 42½@43c; good to choice, 40@42c; store, nominal; California storage, 28@33c; eastern, 25@30.

READING NOTICES

All Reading Notices under this head are at the rate of 25 cents per line.

Do You Want—A Hay Fork Returner? Every farmer having a barn should have one. A hummer for agents. Circulars free. ROONEY RETURNER CO., Box D, Independence, Ia. 50-tf

Foreman Wanted—One having experience in general dairying, a good milker, to have full charge of dairy of 40 cows including the care of young stock, butter making, etc. No farm work. Married man preferred. House, garden and milk furnished. Good wages. Location, northern Florida. Write JUMPIERUN DAIRY FARM, Monticello, Fla, 40-2

Wanted—A single man to work in boiler and separator room, experienced in handling milk and not afraid of work. O. H. BARROW, Roodhouse, Ill.

For Sale—Four registered Holstein bulls ready for service; also a few heifers. FRANK BREWSTER, Bowers, Wis. 40-2

Wanted—Position on Maine dairy farm. Age 21, good habits, good milker. Have had some experience. References. HAROLD STRAW, Guilford, Maine. 40-2

Wanted—A first-class man to manage a thirty cow dairy farm near Wheaton, Illinois. Good wages to the right man. 528 Marquette Building, Chicago.

A Bargain—80 acre dairy farm, all complete and fenced, one-half mile from creamery. Ten head of stock goes with it. Address "B", care Hoard's Dairyman, Fort Atkinson, Wis.

Wanted—Young married man on my dairy, 20 cows, having practical knowledge of feeds and feeding. Must be a good milker; must be neat, active and willing to work, taking an interest in my interests. $45.00 per month and four room house. Some advance as man proves valuable. MARCH, 1798 W. 39th St.. Los Angeles, Cal. 40-2

Wanted—Position by experienced book-keeper. Also capable of testing cream and wrapping butter. References furnished. Address A. B., care Hoard's Dairyman.

Wanted—Position by capable butter maker of 15 years experience in creamery in R. R. town, married. Use no liquor or tobacco. Address COMPETENT, care Hoard's Dairyman. 40-2

For Sale—Up-to-date creamery. Best location in Missouri. Runs the year around. Write promptly for bargain. Address A., care Hoard's Dairyman.

For Sale—Very handsome yearling Jersey bull, also few yearling Jersey heifers bred to freshen the coming winter and spring, all registered and of the richest breeding. A. F. PEIRCE, Winchester, N. H.

At a Bargain—Two Holstein-Friesian Bulls, both registered; one ready for service. the other six months old. Both are fine calves and will sell at a bargain to make room for winter cows. S. I. TATHAM, Licking Co., Outville, Ohio. 40-3

Two choice young Guernsey bulls for sale. MRS. A. W. LEHMANN, Neosha, Dodge Co., Wis. 12-sp

Farm For Sale—A farm of 120 acres with good buildings, 2 orchards, 2 wells, running stream of water. Cheese factory joining farm. 90 acres under cultivation, the rest timber. For particulars write to VALENTINE DIERINGER, Clintonville, Wis. 39-2

For Sale—Two fine dairy farms, vicinity of Washington City. Electric R. R. through one and near the other. For particulars address owner. L. E. WATT, 745 7th St., S. E., Washington, D. C. 39-4

For Sale—Five cheese factories, 20 acres landsaloon and store with stock, three houses in Appleton, Wis., two farms 60 and 80 acres. Address 775 Ida St., Appleton, Wis. 36-tf

For Sale—One choicely bred Guernsey bull by Stella P's Gold Bar, 8368, out of my best cow, 16 months old, warranted a sure stock getter. Also a few choice Berkshire sows and boars, April farrow, at reasonable prices. J. E. STORY, Successor to Nor. Wis. Live Stock Co., Stanley, Wis. 36-tf

Wanted—Experienced butter maker, former instructor in dairying, at present in charge of sanitary milk bottling plant in eastern city, wishes to change position. Address C., care of HOARD'S DAIRYMAN, Fort Atkinson, Wis. 38-5

Wanted—Experienced herdsman for a milk farm. Applicant must state age, experience, references and wages wanted. JOHN D. WALSH, Mont Clare Station, Chicago, Ill. 38-4

For Sale—3 Scotch Collie puppies 7 months old; old male sable and some white; sire and dam registered. Also 4 Holstein bull calves 3 to 8 months old; sire, Sir Dairy B. M. DeKol, and out of choice cows. HENRY WALSH, Sheboygan Falls, Wis. 37-4

The Third Revised Edition of Buff Jersey's Popular Book Just Out of Press—Ten chapters. 25 illustrations and right up-to-date. Subjects treated are: Silos and Ensilage, All Phases of the Dairy Subject, Soil Crops, Up-to-date Farm Machinery, How to Cure Abortion and Milk Fever, Some Medicines and Remedies, The Steam Plant, its care, and many other valuabe things ably treated. Send for circular. Sent post paid, cloth binding $1.00, paper 75c. BUFF JERSEY, Monmouth, Ill. 47-tf

Guernsey Bulls For Sale—I have a few young Guernsey bulls for sale at moderate price, ranging from six months to one year old. These animals are from highly bred sires and mothers of good size and well reared. Good bargains here. W. D. HOARD, Fort Atkinson, Wis. 30-tf

For Sale—A cheese factory in good dairy country, doing good business. No opposition, (cheap.) Address S. O. U., care Hoard's Driryman. 34-tf

For Sale—Two registered yearling Guernsey bulls. RAY BICKNELL, Ft. Atkinson, Wis. 32-tf

Excursion Tickets to St. Paul and Minneapolis and Return—Will be sold by the North-Western Line daily until Nov. 30, 1903, from Fort Atkinson at $14.00 for the round trip, limited to return until Dec. 15, 1903. Apply to agents Chicago & North-Western R'y. 35-8

A Maine Dairy Meeting at Presque Isle.

ED. HOARD'S DAIRYMAN:—Distinctly a potato growing section, Aroostook county, embracing nearly all of northern Maine, has paid little or no attention to dairying, but has devoted all its energies to raising the tubers, practicing a three years' rotation of crops. This state of affairs attracted the attention of Maine's State Dairymen's Association, who, realizing from the experience of those in the western part of Maine, as well as from that of people in the western states, to what extent the soil of this fertile garden of Maine, as it is frequently styled, is being depleted, took up the matter nearly a year ago at the annual meeting of that society and discussed it in all its bearings with the result that a special meeting was called at Presque Isle to bring to the notice of these eminently successful potato-growers, the facts of the deterioration of the soil under their present methods and the desirability of preserving its fertility by some branch of animal industry.

"It is," said State Dairy Instructor Sidney C. Thompson, who has been spending a fortnight in the locality in the interest of dairying, "impossible for us to come here and see your fertile fields lying broad and green, your newly cleared land heavily covered with tender sweet grass, your springs and streams of pure water, without saying inwardly, if not outwardly, what an ideal chance to do dairying.

I am willing to admit that you are doing successful farming without dairying, but I do maintain that you can do successful dairying in connection with your present work, and I truly believe that if you farmers of Aroostook county will use the same care, thought and study with the dairy that you are using in the raising of potatoes, you will be able to double your present profits." He substantiated his remarks at the meeting with figures computed from the actual work of a young man in his own town.

The University of Maine always contributes its quota of speakers to whatever movement may be on foot for the advancement of rural industry, and among those scheduled to address the meetings were, Professors Gowell and Hurd, the latter recently added to the faculty at Orono, from the west and bringing with him all the sturdy vigor of the westerner and the enthnsiasm of a young man thoroughly interested in his calling, the opening words of his address, "We will educate your boys to stay on the farm," speaking volumes for his worth to the farmers of the state.

Gilbert M. Gowell, Professor of Animal Industry, took for his subject, "The dairy cow and how she may be made profitable." Starting with the potato industry, he reminded the Aroostook farmers of the hard times following the failure of that crop for three successive years; referred to the gradual depletion of the fertility of the soil under the present method, and spoke eloquently in behalf of the dairy cow. "I do not advise you," said he, "to abandon potatoes, but to use the dairy cow as a means to double your output." He traced her origin from the time the first wild cow was ever milked by a human being down to the present day of special types and remarked the equal development of man and brutes. He spoke of the intensive operations carried on where the Jerseys and Guernseys originated, urged the importance of a liking for dairy work and showed how strong was the bond of sympathy between cattle and their keepers and how this bond subserved the pecuniary interests of their owners, closing with a strong plea in the interests of hired help, for the chores to be part of the day's work "instead of ex. tra work without extra pay," for he argued, "the hired man can not otherwise do good work.

Prof. Hurd treated of "Economical Dairy Food," dividing his subject into four distinct parts, viz., grasses and pastures, silage crops, root crops and soiling crops. Under the first heading Prof. Hurd said: "There are but few grasses grown in any one locality. Among those that might be raised here are Orchard and tall oat grasses, Meadow Foxtail and Russia Brome grass, the latter of which has the following characteristics to recommend it, especially for pasture lands: It can endure almost any amount of cold or, on the other hand, it can stand high temperatures during the summer months. It will withstand drought better than any of the other grasses, or it will thrive better than most grasses when considerable moisture is present. It matures early in the north, ripens soon after it heads, and stock relish it more than any of the grasses with, perhaps, the exception of Orchard grass. Its feeding value is equal to timothy. It furnishes more grazing and stands closer cropping than other cultivated grasses, is ready for pasturing earlier in spring than others, furnishes late autumn pasture and seems to me to be worthy of the strongest endorsement. The high price of seed can be overcome by raising a little and from that obtaining seed with which to start.

Clovers are unsurpassed in feeding value, and no other crop can be grown on the farm that will maintain fertility and leave the land in better shape than the clovers.

Prof. Hurd then spoke of soils in a "sour" condition, gave method of testing with blue litmus paper and prescribed the application of lime, a ton to the acre, just after ploughing, the same to be thoroughly harrowed in. For meadows not yielding as they ought, he recommended a mixture for top dressing, as follows: 200 lbs. nitrate of soda, 200 lbs. muriate of potash and 400 lbs. acid phosphate per acre, the cost of which is from $9 to $10 and the increase in yield threefold, or even more. Pasture land he would stimulate in a similar way, and would never undertake to establish a permanent pasture on lands in a low state of fertility. The growing of roots as a cheap food, he thought, should be encouraged, especially mangels, being easily raised and both succulent and nutritious.

Concerning the third class he said "the silos and silage is the greatest boon known to stock feeding. It is generally conceded that 3 tons of silage are equal in feeding value to one ton of hay. On this basis an infinitely larger amount of

"ADVERTISEMENT."

LET YOUR STOMACH HAVE ITS OWN WAY

Do Not Try to Drive and Force it to Work When it is Not Able or You Will Suffer All the More

You cannot treat your stomach as some men treat a balky horse; force, drive or even starve it into doing work at which it rebels. The stomach is a patient and faithful servant and will stand much abuse and ill treatment before it "balks," but when it does you had better go slow with it and not attempt to make it work. Some people have the mistaken idea that they can make their stomachs work by starving themselves. They might cure the stomach that way, but it would take so long that they would have no use for a stomach when they got through. The sensible way out of the difficulty is to let the stomach rest if it wants to and employ a substitute to do its work.

Stuart's Dyspepsia Tablets will do the work of your stomach for you and digest your food just as your stomach used to when it was well. You can prove this by putting your food in a glass jar with one of the tablets and sufficient water and you will see the food digested in just the same time as the digestive fluids of the stomach would do it. That will satisfy your mind. Now, to satisfy both your mind and body take one of Stuart's Dyspepsia Tablets after eating—eat all and what you want—and you will feel in your mind that your food is being digested because you will feel no disturbance or weight in your stomach, in fact, you will forget all about having a stomach just as you did when you were a healthy boy or girl.

Stuart's Dyspepsia Tablets act in a natural way because they contain only the natural elements of the gastric juices and other digestive fluids of the stomach. It makes no difference what condition the stomach is in, they go right ahead of their own accord and do their work. They know their business and surrounding conditions do not influence them in the least. They thus relieve the weak stomach of all its burdens and give it its much needed rest and permit it to become strong and healthy.

Stuart's Dyspepsia Tablets are for sale by all druggists at 50 cents a box. They are so well known and their popularity is so great that a druggist would as soon think of being out of alcohol or quinine. In fact, physicians are prescribing them all over the land and if your own doctor is real honest with you, he will tell you frankly that there is nothing on earth so good for dyspepsia as Stuart's Dyspepsia Tablets.

THE
Iowa Dairy Separator.

AN UP-TO-DATE MACHINE
REPLETE WITH PRACTICAL IDEAS

It is built in the following sizes:

250, 350, 450, 600, 750 POUNDS PER HOUR

Our 750 pound per hour machine is a practical Hand Separator. It is as easily run as most separators of 450 pounds and 500 pounds capacity.

SEND FOR CATALOGUE NO. 60 AND PRINTED MATTER.

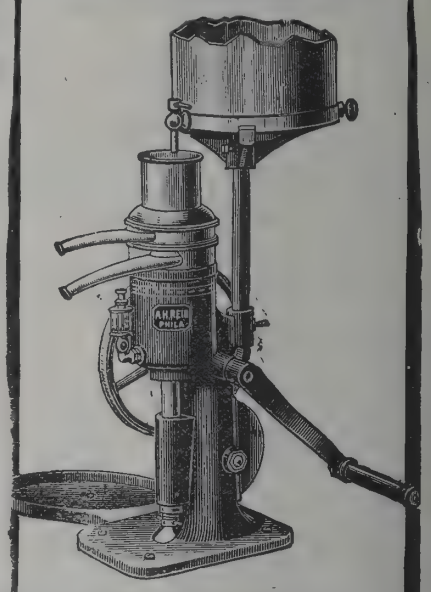
Clark's Tools for Large Hay Crops

CLARK'S REVERSIBLE
Bush Plow and Harrow

Cuts a track 5 ft. wide, 1 ft. deep. Connects the sub-soil water. It is an excellent machine for covering in sugar cane. Strength guaranteed. Can plow a newly cut forest, stump, bush or bog land, leaves the land true and clean for grain or any crop.



Clark's Dbl. Action Cutaway Harrow
Moves 15000 Tons of Earth a Day.

Clark's 8 foot Smoothing Harrow.
Will smooth an acre as true as a mill pond in twenty minutes.

THE
CUTAWAY HARROW CO.,
HIGGANUM, CT., U. S. A.

Reid's Hand SEPARATOR

The "best" separator is that one which does its work most thoroughly and easily, that is built of strongest material, and that is most easily washed and kept in order.

First cost is a great point with a buyer, but ease of running, perfection of skimming and simplicity in washing are even greater considerations.

The **Reid Hand Separator** has but a single cylinder inside the bowl, and skims as closely as one-hundredth of one per cent. Indeed, some tests indicate "not a trace" of fat in the skim milk.

The Reid is perfectly planned and strongly built, and it literally "runs like a watch."

As to our guarantee of excellence, we make the strongest statement that can be expressed in words: **Money back (less freight) if the buyer is not satisfied.**

There is a new (free) booklet about the Reid Hand Separator.

Sizes run from 150 lbs. to 500 lbs. per hour.

MILK DEALERS COMBINATION Milk Protector, for cans or bottles. Prevents milk churning and souring in summer and freezing in winter. INVESTIGATE. S. C. Sullivan Mfg. Co., Erie, Pa.

food can be obtained from an acre of corn than an acre of hay and it will occupy much less room. The gentleman went on to show the cost, manner of constructing and capacity of different sizes in silos stating that their general acceptance needed no further discussion.

Prof. Hurd dwelt at length upon soiling, giving statistics which showed it to be much cheaper from a financial standpoint than pasturage because of the greater yield in product, the extra fertilizer saved and the elimination of fence building.

A system of crops for the season might he thought follow out this order. In the fall sow winter rye to be used the latter part of May or June. Where possible to grow it, wheat sown at the same time will follow it closely in maturing. Sow as early in the spring as possible oats and peas to follow the rye and wheat. Corn may be sown in the spring to follow the oats and some of the land from which the oats and peas have been cut can be sown with millet to be used in the late autumn.

Concerning exhausting the fertility of the soil, in closing he said, "better take a word of advice from your western brother who thought corn and wheat could be grown as long as desired without change of crop and who now sees Canada exporting wheat which was forced out of his section and by a careful system of rotation, retard soil exhaustion. Massachusetts, Vermont and the Provinces were represented in the list of speakers.

W. W. Hubbard, Agricultural Agent of the Canadian Pacific, told something of the conditions existing across the border and not unlike were they to those on this side the St. John Valley. The "Missing Link" which was the somewhat fanciful subject of his talks being the man who loved cattle and knew how to care for them, and a "*rara avis*" he seemed to be in Aroostook and vicinity. One thing especially interesting in his remarks was that the Canadians are raising a bacon pig and getting from 14c to 15c per pound. He is separate and distinct from the corn fed animal and is grown on the by-products of the dairy together with pasturage. With 20 cows, from 100 to 150 pigs can be kept. Mr. Hubbard compared the beef industry with dairying, showing quite a balance in favor of the latter and urged the adoption of one industry or the other, circumstances determining which, for the conservation of fertility.

Dr. J. L. Hills talked upon the dairy cow considering her in the light of a machine, her feed being the fuel; her product he looked upon as her manufactures and the "man behind the cow" as the most important of all. As a manufacturer considers the cost of production and utilizes all waste so should the dairyman; as there are good machines and poor so there are cows that eat more than they give and cows that give more than they eat and the sharp business dairyman will weed out the former class and cultivate the latter.

He should test his milk twice a year, weigh it three days in the month, and keep an observant eye on the eating habits of the cow. Too many farmers are manufacturing butter or cream with out-of-date or imperfect cow machines. The cow uses, besides water and bone building material, protein and carbohydrates, the latter usually grown on the farm, the former bought to a certain extent. Cottonseed, gluten and linseed meals and distillers grains supply this want better than other by-products on New England markets, but care should be exercised in economic feeding.

Concerning quality, Prof. Hills said: "Dirt is matter out of place, and the quality of the product is affected by it. The living dirt bacteria yields to sunshine in the tie-up and dairy, whitewash, good ventilation and boiling hot water on dairy utensils." The gentleman urged, as other speakers had done, dairying as a means of keeping up the fertility of the soil, and advised all who contemplated following the good advice so freely given to place themselves in training for the work, that the manufacturer should become the cultivated, intelligent person so needful to good work and good citizenship.

J. A. Roberts, of Norway gave his method of caring for swine, which he considered the most profitable side line. It included a liberal supply of light and air with perfect cleanliness, regularity and attention to details, matters which are shamefully neglected by most farmers who raise the porkers.

Hon. P. M. Harwood, General Agent of the Massachusetts Dairy Bureau, talked upon the Dairy Laws. He thought, if, after the farmer had educated himself along all the lines neccessary to successful dairying, he then had to contend against frauds in the market, that it was indeed hard lines. He gave a brief sketch of how the different spurious articles were manufactured, and the laws governing their sale, and told how by their enforcement the market had to a certain extent been cleared up. The Massachusetts Milk Standard law, which requires that milk shall contain 12 per cent of solids 6 months of the year, and 13 per cent the remaining 6 months, had largely done away with milk adulteration.

He explained that the first penalty of $100 for neglecting to stamp renovated butter as such, was excessive and defeated its end, but the present penalty of $25 had so far worked well, no cases being lost since the amendment. He declared oleo practically legislated out of existence by the United States law which places a tax of 10 cents per pound upon the colored article and ¼ cent upon the uncolored, although some cases are still pending.

The United States has some chemists that are sharp on the track of violators of the law and their methods of detecting fraud are carefully guarded. Mr. Harwood in closing made a powerful plea for honest work, honest goods, and honest money.

Local speakers and others made pertinent and interesting remarks. A fine display of dairy products, together with separators and other machinery go to show that some of the farmers of Aroostook have thrown out an anchor to windward in case of failure of the potato crop in the future, and do not intend to allow their potato yield to lessen through deterioration of the soil. M. B. A.

Brewer Me.

Shutting Veals in Dark Stables etc.

Was much interested in the part of the paper read by Prof. Hayward regarding the raising of veal calves. Would like your opinion of shutting them up in a dark stable, as he spoke of. He also spoke of giving them all the milk they would drink. I should think they would drink more than they ought. M. L. C.

Manchester, Iowa.

It is a common custom in Europe to confine veal calves in dark pens, but not much practiced in this country so far as we are advised. The claim is made that such treatment produces veal of a more acceptable color. After calves are two to three weeks old, there is not much danger of overfeeding on warm skim milk, when fed in limited amounts at a time.

All Kalamazoo ranges and cook stoves are equipped with patent oven thermometer. Makes baking sure and easy.

The KALAMAZOO

A better stove or range than you can get from any other source. A saving of from 25% to 40% in price. Prompt shipment from factory to user. Factory prices—no dealers' profits. Freight prepaid by us. 360 days approval test. Guarantee backed by $20,000 bank bond.

KALAMAZOO
Stoves and Ranges

are manufactured by us in our own factory. We know they are all right "clear through." Don't confuse them with cheap mail order goods.

We are the only stove manufacturers in the world selling their entire product direct from their own factory to the user.

There isn't a better stove or range at any price

and by eliminating all dealers' and middlemen's profits we save you easily 25% to 40%. Moreover we give you a 360 Days Approval Test. If your purchase is not satisfactory in every way, return the goods at our expense. We have a complete line of ranges, cook stoves and heaters for fuel of all kinds. All stoves blacked, polished and ready for business.

It will pay you to investigate.

Send for catalog No. 163 and prices, freight prepaid.

The Cow Demonstration at the World's Fair.

Col. H. H. Hinds, Stanton, Michigan, who has charge of the Short-horn cows that will take part in the World's Fair test, at the recent St. Louis meeting of Live Stock Herd Book Associations, spoke in part as follows:

"Mr. Chairman and Gentlemen of the Committee:—It is certainly a great honor to be invited to speak to a gathering of gentlemen engaged in such important service as that represented by this convention.

"My attendance at this meeting was largely for the purpose of hearing the address of Mr. Hemingway on The Cow Demonstration at the World's Fair. I share with you in the disappointment occasioned by the absence of Mr. Hemingway, and regret that we will not have the privilege of hearing from him on a subject in which all the breeders of cattle are interested, and especially the men who have made investments in the dairy breeds.

"Your unexpected invitation to fill in the time assigned to the paper of Mr. Hemingway, while very unexpected, is accepted with the understanding that little will be expected from an impromptu effort.

"The officers of fair associations, the managers of race tracks spend money in providing accommodations for exhibits and speed contests, and make large expenditures to provide facilities for producers and breeders to exhibit and demonstrate the excellence of their wares.

"The man who breeds trotting horses and advertises them for sale as having speed will not discharge his duty to the public, and his stud, unless he participates in public exhibitions and demonstrates the merit and winning qualities of his stock.

"Secretary Hemingway represents an association of breeders of dairy cattle, a breed that its promoters on all occasions esteem it a privilege and duty to exploit for what is claimed for the breed. I am interested in another breed of cattle, and shall make no attempt to represent him or his worthy breed on this occasion.

"The breeders of Jersey cattle and the officers of the Jersey Cattle Club are enterprising gentlemen and have faith in the breed, and, I guess, have never failed to bring their Jerseys to the fairs or to take part in any test, that provides an opportunity for demonstrating their confidence in the dairy qualities of their favorites.

"There are several other breeds of cattle for which much is claimed for milk and butter production, but their owners seldom if ever come to the scratch when an opportunity is given to publicly demonstrate their comparative excellence.

"It is about time for the men who do so much boasting about the dairy qualities of certain breeds to put up or shut up, or to be more explicit, to take part in public dairy demonstrations or to quit boasting about a breed that the owners admit by their universal absence from public trials are sadly deficient in the qualities claimed.

"I am interested in the Short-horn breed of cattle which the breeders prove on all occasions to be the best of the dual-purpose breeds. We claim and prove the Short-horn to be the best class of beef cattle. We show our cattle at the state fairs and expositions and fat stock shows, and have proved that they are first-class beef cattle. We have carried the blue ribbons won in competition with other breeds into our camp time and again, and have no lack of confidence in our ability to continue to win in hot competition.

"Now the Short-horn breeders, with the advocates of other breeds, claim not only superior beef qualities, but that the breed has much merit for dairy purposes. We claim that the Short-horn is the best dual-purpose breed of cattle, and we are eager to demonstrate that the Short-horn cow can return a good profit as a rich milker, and still produce calves that make choice steers that can win in the block test.

"Now, gentlemen, when the Louisiana Purchase Exposition provides the opportunity and the facilities for a cow demon-

"IT'S UP TO YOU!"

stration, and invites the representatives of the cattle associations to make equitable rules and conditions for such a test as will meet all the requirements of the butter and cheesemaker—the farmer who wants a milk and beef breed as well as the dairyman who sells his milk for consumption—it becomes the imperative duty of the officers of cattle associations to come to the front and make good their claims. That is what the Short-horn Association is going to do. Now, it is up to the advocates of other breeds of cattle to get into line and show the public what their cows can do, or to quit boasting.

"The coming World's Fair demonstration of cows is planned upon advanced lines. The demonstration in its scope is far in advance of all former investigations and fully in keeping with the experience of the most successful, practical dairymen. The World's Fair Dairy Test covers the entire field of the producers of milk and the products made therefrom.

"The breed of cattle that has the special merit of a large flow of milk that is known as commercial milk, has a separate class.

"The breed that produces milk especially valuable for cheese making has a separate class.

"The breed that yields milk in which butter fat predominates has been provided for.

"A class has been provided for the cow that fills the requirements of a dual-purpose animal, and she will be represented with the best milkers and calf producers to be found.

"I am perhaps making this informal talk rather pointed, but I feel like talking plain and earnest about this very important matter. I feel doubtless like the breeders of all other breeds of cattle, that the men who make claims for their cows either as strictly dairy animals or as dual-purpose animals should exploit their wares in the World's Fair Demonstration.

"The managers of the World's Fair, and especially Mr. Coburn, the Chief of the Live Stock Department, has done everything that the cattle associations have asked, or that is needed to make this demonstration a success, and no sane man questions the impartiality or integrity of all connected with the Exposition who will have any part in this matter.

"Mr. Taylor, the Chief of the Department of Agriculture of the Exposition, who will have charge of the milk and the manufacture of products therefrom has personally assured the representatives of the cattle associations taking part in the World's Fair demonstration of cows, of his entire willingness to carry out any and all lines of demonstration in the manipulation of milk that will aid the dairymen in determining matters of especial interest to the maker of butter and cheese, or the milkman who provides milk for city or other consumption.

"It is the wish of the members of the cattle associations, taking part in the World's Fair cow demonstration to conduct experiments along lines of investigation that most deeply concern the practical dairyman who makes his living by the manufacture or sale of milk, or in raising dual-purpose cattle.

"Having participated in frequent meetings of the representatives of the cattle associations, called by the Exposition officals, and to which conferences all the dairy cattle and other cattle organizations were invited, I can speak advisedly as to the purpose of chiefs Coborn and Taylor to have such conditions adopted as will cover the entire field of the demonstration of cows in all matters in which the practical dairymen and breeders of cattle might be especially interested.

"I personally regret that so few breeds will be represented in the demonstration as there will certainly be a depreciation in the public estimation of breeds not participating, in proportion to the creditable performance of the breed taking part in the publicity given the same which will be world-wide.

"A very important and new departure in the World's Fair demonstration of cows is provided for in the rule which specifies that the record of the cow will be determined by her performance at the pail. No manipulation by the butter or cheese maker, or the dairyman, can detract from the cow's rating under the rules agreed upon.

Another wise provision has been made in the Exposition rules relating to the demonstration of cows at the World's Fair that will enable one or more enterprising breeders of any breed of cattle not represented by associations to enter cows as individuals. The liberal spirit of the managers of the World's Fair in this connection is very apparent when it is known that the milk or the product made therefrom is to be turned over daily to the cattle association interested or the individual owners having charge.

Life Membership, $25.

Advanced Register in charge of Supt. HOXIE, as above, who will furnish all information and blanks therefor.

Address F. L. HOUGHTON, Putney, Vt., for information relating to Registration of Pedigrees.

HOLSTEIN CATTLE! The Choicest Milk and Butter Breed in the World. Write to WISCONSIN LIVE STOCK ASSOCIATION, Appleton, Wis., U. S. A.

THE STEVENS HERD Contains at the present time the young bull, Vale, with the largest official backing of any bull ever born. Several half-brothers and sisters to Vale, and a large number of cows and heifers bred to his sire, whose official backing is larger than that of any other bull ever in service. A cow that stands unequaled by any other that ever lived, in the official work of herself and daughters. The only cow ever officially tested for six months. Eighteen cows and heifers with official 7-day butter records averaging, by the 80 per cent. factor, over 20 lbs. each. Thirty animals whose dams have made official 7-day butter records averaging over 20 lbs. each. Why not get our prices before buying?
HENRY STEVENS & SON,
Brookside Stock Farm. Lacona, Oswego Co., N. Y.

HOLSTEIN-FRIESIAN BULL CALVES

Do you want one for use this winter which will improve your dairy herd? Do you want him elegantly proportioned, with straight back, high rump, and all the dairy points? Do you want one whose relatives are A. R. O. and eligible to the Advanced Register himself? If so, I have a choice lot, just such as you want.
MALCOLM H. GARDNER, Darien, Wis.

Butter and Cheese.

Making Home-Made Cheese.

ED. HOARD'S DAIRYMAN:—Cheese has been selling between 11 cents and 12 cents for the past month at the local board, but this high price was not sufficiently encouraging to the managers of the local cheese factory to run the season out. They stopped operations on the 10th of October for the season. "The patrons want to make butter for the winter," they said. "The milk is getting small," "The weather is getting too cold for milk." These were the reasons. Twelve cents a pound for cheese means 94 cents per cwt. for the milk net at the factory. That's about as high a price as anybody ever expects to get for milk drawn to the factory by the milk-drawer in this or any country, at any season of the year, and yet the wise and prudent (?) patrons of this particular factory thought it more profitable to keep the milk at home and make butter. They did not also think it paid to feed the cows extra and to house them nights. The above speaks volumes for the status of the industry in these parts.

They do not think it profitable to set up the factory for butter making in the fall and early winter either, as the outfit "costs too much." There is no considering the fact that they do not recover more than two-thirds of the butter fat in the milk these days, by the universal plan of creaming, deep setting and shallow pans. I believe that the loss of butter fat in creaming these days, with the average patron, is nearer two per cent than lower, and by the primitive methods in use of ripening and churning the cream, the total loss of butter fat of the milk kept at home is, at present, fifty per cent, and yet they find it more profitable to keep the milk at home than to make cheese at the factory, or put in a butter plant. A campaign of education is, therefore, badly needed in these parts. There is only one hope for about ninety per cent of them, and that is a "funeral."

Since we were forced to keep the milk at home we have begun, as usual, to make butter and cheese. It is a great additional trouble in the family to have to curd the milk twice every day and make a cheese, but it is "the devil or the deep sea," and the additional value of the milk over straight cheese or butter making pays well. Not having a separator, it would pay us better to shoot the cows, or allow them to dry up entirely, than to try to make a profit from butter making alone this time of year. The best we can do with our shallow pans and deep setting combined, with milk diluted fifteen per cent water, is three and one-half pounds butter per hundred pounds milk, and as butter must be A 1 to fetch 20 cents the pound, a cwt. of milk would only bring us 70 cents.

Of course the skim milk would go against this, but we find that warm, fresh whey is almost as appetizing to the pigs as skim milk. In order to get 3½ lbs. butter per cwt. milk, we find it necessary, besides diluting, to let the milk stand in the pans 40 hours, 36 not being long enough in this cold weather for all the cream to rise.

In our case, however, we do not want more than three pounds butter from a hundred pounds of milk as we want the skim milk fairly good for cheese making, one and one-half to two per cent fat. There is a ready market here for home made, or cottage, cheese made small, about five to ten pounds. They sell readily at eight cents per pound, and with milk containing 1.5 to 2 per cent fat, the cheese from it is not bad, if made scientifically. We believe the cheese we are making is equal in many respects to ordinary factory,—better than June factory, we are sure.

We are therefore at the present time, getting three pounds butter and 7½ lbs. cheese per cwt. milk, which makes a satisfactory profit, and we don't know of any other way of manipulatiug the milk in October and November that we could make it realize so much.

3 lbs. butter at 20c	$ .60
7½ lbs. cheese at 8 cents	.60
100 lbs. milk	$1.20

And we have the whey, fresh and warm for pig feeding, worth, at least, 10 cents per cwt. to the good. There is, of course, a lot of bother in making the cheese. but we have good appliances, and rennet and coloring, and a good thermometer. We have about 50 pounds of this half skim milk, morning and evening; as you know, we have but six cows. This fifty pounds milk is warmed in an ordinary kitchen boiler, which is, however, not the best. We warm it more than 86° F., as our milk being thirty-six hours old is over ripe, and so we warm the milk to 94° F. To this amount of milk we add one teaspoonful ordinary factory rennet diluted in a half cupful of water, and add also a half teaspoonful of coloring. We then take it off the stove and place it longside, and cover the boiler with a cloth, and so keep the temperature to 90 degrees. In fifteen minutes it coagulates sufficient for the knife; we then lift it on the stove and cut the soft curd into small pieces and allow it to cook, keeping the temperature at not over 100° F. In ten or fifteen minutes it is ready to "dip." At this time we do not bother with a hot iron, neither do we run the whey off as they do at the factories. We take it now off the stove and let the curd settle to the bottom, and when sufficiently matted take up the whole thing and drain. After a while we then cut it up, finishing with the hands, getting it into small pieces or cubes; add a little salt and put away until evening.

In the evening, the same routine is gone over and make a cheese. After we get the evening milk into small pieces of curd, we bring along the morning's curd

PERFECT POWER

"EAGLE" 4 H. P. STATIONARY ENGINE

1904 MODEL

THIS ENGINE is of the four Cycle type and is especially designed and adapted for use on the farm—for separators, churning, pumping, elevating, hoisting, cutting ensilage, etc. No Expert or Engineer required to operate it—very simple in design and compact in construction. This engine is built so it can be easily moved from place to place. We can supply a special belt driven pumping jack to be used in connection with any pump having a wind mill head. Write for prices and description to

EAGLE BICYCLE MANUFACTURING CO.,

Engine Department. TORRINGTON, CONN.

and warm it up and mix with the evening's curd. We now have enough to make a small cheese. We salt at the rate of four and a half ounces to a hundred lbs. milk. As the cream is taken off this milk of ours, we have not more than 85 pounds of milk of the original 100 pounds, so that we salt this much with about 3½ to 4 ounces. We now put in press, lining the press first thing with a cloth, and into this cloth put the curd, wrapping the ends snugly over top. These small cheese do not require much pressure. About 20 pounds pressure is sufficient anyway, and I think less would do. In a few hours the cheese is turned in the press and is allowed to press two days, when it is taken out and placed in a room where the temperature does not go much below 60°.

The *modus operandi* is much the same as in the factory, only we are not so particular, nor do we take so long in the process. In the factory with fresh milk to begin with, the time is necessarily lengthened to get the milk, first, at the proper ripening stage to receive the rennet; then to get the proper degree of acid in the curd as shown by the hot iron test. To get the proper degree of fermentation or acidty of the curd takes, in the factory, several hours from the time the curd is ready for the knife to the mill and press. Then John Bull is more dainty than are our customers, and for export cheese enough care cannot be taken to make a respectable article, and nothing but full cream cheese is permitted to be exported.

We believe the Canadian laws are against skim cheese. We think this law, on the whole is a good one, but we see no reason why skim cheese, or rather partly skimmed cheese, could not be made in the fall months for domestic consumption, by the factories. There is no way in which the patron could get more money for his milk than by combined butter and cheese making. As good a cheese could be made in October, November and December on partly skim-milk as on whole milk in May or June, and I believe very much better.

There is money in the business for the factoryman that will contract with the farmers in the fall for their skim-milk. As the farmer's skim-milk in the late fall months contains about 2 per cent butter fat, a very fair quality of cheese could be made from it. And this farmer's skim-milk could be purchased at their doors for about fifty cents—perhaps considerably less—per cwt. and with this milk there would be no difficulty in getting 8½ lbs. cheese from the cwt. milk.

This skim-milk would be in every bit as good condition for cheese making as the whole milk in the hot month of July, while the product would be every bit as good as July full cream cheese. What is the sense therefore in having a law on the statute prohibiting the making of skim cheese. Certainly, cheese from separator milk should be prohibited, but milk from the farmer's dairy where shallow pan and deep setting is followed is widely different. I believe no cheese should be made from milk containing less than 1.5% butter fat, and this only after the middle of September. In purchasing such milk the test should be the apportioner of values.

Starting a Creamery.

ED. HOARD'S DAIRYMAN:—Seeing the article of E. B. H., Retreat, Wis., wishing advice as to starting a creamery, I will say by all means drop the promoting agents. I can judge by experience, as ours was built that way. They generally want big pay for a lot of cheap and not satisfactory goods and sometimes give one or more subscribers their share free gratis, and such ones are a curse to any enterprise.

My plan would be to get the necessary amount of cows to insure success and then get capital as you suggest, and employ a good buttermaker, after selecting a capable and honest secretary and man-

Baby Costs Too Much

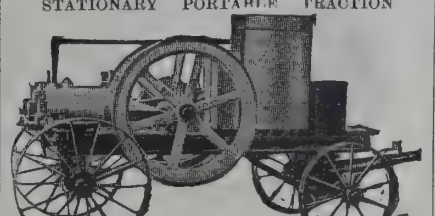
When the price paid is the mother's health and happiness. The father doesn't realize as he romps with the child what years of wifely suffering must be set against the baby's laughter.

Chronic invalidism is a high price to pay for the painful joy of maternity, yet it is at such a cost that many a woman becomes a mother. Such a price is too much because it is more than nature asks.

By the use of Doctor Pierce's Favorite Prescription maternity is made practically painless, and a quick convalescence is assured in almost every case.

"I am pleased to give my testimony and wish I could find words strong enough to induce other sufferers to use Dr Pierce's Favorite Prescription," writes Mrs. Wesley Guy, of Kemptville, Ont., Box 6. "For eight years after my little boy was born I suffered with female weakness, also soreness in ovaries, especially on my right side, and pain in back. Was so miserable sometimes did not know what I was going to do. Tried several doctors but derived no benefit until I began using Dr. Pierce's Favorite Prescription. Had only used four bottles, also some of Dr. Pierce's Antiseptic and Healing Suppositories, when I felt like another person. I recommend Dr. Pierce's medicines to all my friends, If anyone wishes to write me I will gladly answer."

Dr. Pierce's Favorite Prescription contains no alcohol and is entirely free from opium, cocaine and all other narcotics.



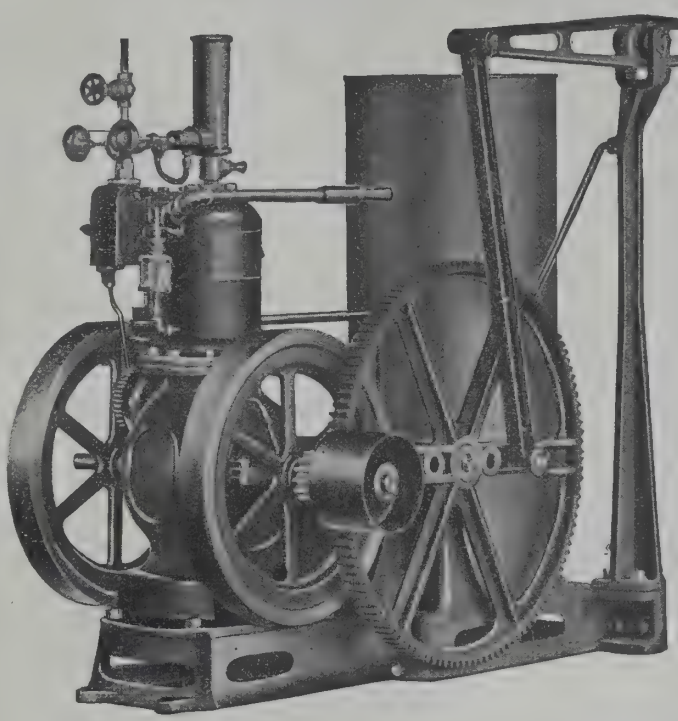
The dealer who offers a substitute for "Favorite Prescription" does so to gain the little more profit paid on the sale of less meritorious medicines. His profit is your loss; therefore, accept no substitute.

Dr. Pierce's Pleasant Pellets regulate the bowels.

THE OLD RELIABLE
MILWAUKEE
Gasoline Engines
Are easy to start, simple and economical. Highest grade at a reasonable price. Look at the governor. The smoothest running engine on the market. All sizes, both stationary and portable. Send for catalog. Specially adapted for farm work. Built by **MILWAUKEE MACHINERY CO., 290 E. Water St., Milwaukee, Wis.**

BADGER GASOLINE ENGINES
STATIONARY PORTABLE TRACTION

This is our new improved 1903 Portable, built on practical lines. Guaranteed horse power. Easy to start; operates successfully in zero weather. No vibration when running light or on full load. Winner in appearance. Every engine sold on fair trial, fully guaranteed. Write for catalogue No. 5, prices and terms.
C. P. & J. LAUSON, 103 West Water Street. Milwaukee, Wis.



The "Penny Wise and Pound Foolish"

Policy has an apt illustration in the man who buys a CHEAP gas or gasoline engine. Unreliable service, frequent and expensive repairs, wastefulness in fuel and short life offset many times over, the small saving in first cost. The "OTTO" is the original and BEST. Suppose it does cost a little more money, the extra dollars are well invested. 70000 users throughout the civilized world support us in this claim.
THE OTTO GAS ENGINE WORKS, Philadelphia, Pa.

The Model Gas and Gasoline Engines

ager. The buttermaker should know plans for a good, handy building, the best machinery that would be needed and how to place same in building to best advantage.

The greatest reason I suggest to hire buttermaker at the start is, that one will be needed when ready for actual business, and I think a man that has had experience knows best plans for a handy building and the most desirable machinery to do the work.

A good creamery is a blessing to any locality. This is the third year for ours, and we will pay $30,000 to patrons. Paid $4,300 in June. A. A. SHOEMAKER,
Buttermaker and Manager C. I. C. Co.
Nokomis, Ill.

A New York Silo.

ED. HOARD'S DAIRYMAN:—This is, perhaps, a little out of season to give a description of a silo, but I have one that is, according to my way of thinking, so much superior to the ordinary stave silo, considering cost and everything, that it seems worthy of mention, and it stood the tests of last winter without cover, more than just to keep out snow.

This silo is built of 2×4 hemlock studding, set one foot apart, spliced at 4, 8 and 12 feet, with plate and sills of 2×4, doubled. Inside the studding is bent ⅜ green hemlock, then lathed and plastered; the first coat being of lime and hair and the second of cement, put on while the first coat is yet soft and from the same staging.

The doors are of 1 inch pine nailed on heavy strips to keep them from springing, fitted to jambs that are set in the studding and plastered in. The outside is hooped with flat iron hoops over each set of joints in the studding.

The cost of material for a silo 12×30 need not exceed $50, and as the hired man and I did all the work but plastering, it surely seems as if they might soon be the "coming silo."

"LYNNDEN DAIRIES."
Jamestown, N. Y.

CONCERNING OUR ADVERTISERS

HANDY LOW DOWN WAGONS.

This is the season of the year in the corn growing sections when the man with the low wagon has the advantage of his neighbor who uses the high wheel. One has only to drive through the country and witness the loading of fodder to be forcibly impressed with the labor that's saved in one field and the energy that's needlessly wasted in the next. Another fact is equally patent and that is that there has been a remarkable increase in the number of the low wheeled wagons in recent years. The low wheel has the better of the argument for all farm work. This has been proclaimed time and again as the result of competitive draft tests, and is abundantly proven from the standpoint of convenience every day by the great army of users.

The Electric Wheel Company of Quincy, Illinois, has perhaps done more than any other one institution to popularize the low wheel and Handy Wagon. Their "Electric" Steel Wheel is the kind that is made to last. An item that has multiplied the number they are constantly sending out is that they are made to fit the skein of any make of wagon. The wheels being the first to give way in the wooden felloe high wheel style of wagon, a great many farmers take advantage of this fact and procuring the "Electric" wheels, convert their old wogons into Handy Wagons. In most cases the running gears are good and with little expense they secure a wagon as good as new, with all the conveniences which the use of the low down Handy Wagon carries with it. If any reader of this finds his old high wheels giving way, he will do well to send to the above company for their catalog and learn what their low steel wheel will do in the way of giving him practically a new wagon at but very slight cost. It must not be forgotten that the company makes the best Handy Wagon complete where parties desire it.

Milk Fever.

ED. HOARD'S DAIRYMAN:—I have been a reader of your valuable paper for many years; every week it comes to us as a friend and consoler. I am somewhat perplexed now and wish, if possible, you would advise me.

When I see the words "milk fever," I shudder. I noticed on page 822, an article by Dr. Pearson in which it is recommended to feed silage and grass to cows that were dry. Can this be possible? I lost two that were on grass last season. Neither cow was what you could call fat, and I laid it to the grass. Since then I have taken my cows off grass prior to calving, during the summer, and have withheld the silage during the winter, giving nothing but hay and water the last week or two before calving. Is this a mistake?

I am having trouble with my cows every year; there are one or two that retain the placenta. Can you advise a cure? Please give direction for administering a physic to a cow. E. G. C.
Randolph, Wis.

1. A well fed cow which is preparing to give a large flow of milk is liable to get milk fever whether fed on grass or not. It is true that more cows contract this disease during the grass season, but it must be remembered that more cows come fresh during this season than any other, which accounts for the larger per cent of cases. Your preventive measures are all right. Feeding dry feed several weeks before calving time is the proper preventive.

2. Lack of tone to the uterus is the cause of retaining the placenta. You may give the cows which you suspect, a teaspoonful of the following powder: Powdered gentian root, 4 ounces; dried sulphate of iron, 4 ounces; powdered nitrate of potash, 1½ ounces. Mix and give twice daily.

3. To physic an ordinary cow, take 1¼ pounds of Epsom salts and 2 ounces of ginger to a quart of warm water and give as a drench at one dose.

VETERINARY.

Queries in this department answered by DR. A. H. HARTWIG, Watertown, Wis.

Sore Teat.

I have a cow with the skin broken on the end of her teat so the scab covers the end of the hole and when I milk her I have to open the sore every time, so it don't get a chance to heal.
Valentine, Neb. M. D. C.

ANSWER.

Apply oxide of zinc ointment after each milking.

Heart Failure.

We allow our Jersey heifers to run on a wild tract of land of about 190 acres. Most all of the grasses of this locality grow on it, such as blue grass, sage grass, and several kinds of weeds and bushes. The other day I found one of the heifers lying dead: she was lying as if she were asleep, with her head on her shoulder. She seemed to have died without a struggle and was not bloated but looked as natural as could be. Do you have any idea what was the matter?

One of our cows got her teat cut to the center. I had it sewed up, but the stitches pulled out and the teat has healed up, leaving a large hole in the side. A. W.
Mitchell, Ind.

ANSWER.

As near as can be learned from your description. your heifer died from heart failure but we cannot state positively.

The teat can be mended when the cow is dry by confining the cow and scarifying the edges of the opening, thereby making a new wound, then bring the edges closely together with a suture and cover with adhesive plaster.

To Hasten the Period of Oestrum.

What shall I give a heifer that has had one calf, to make her come in heat, she has been in now for about four months, and shows no signs of coming in heat? M. G. DeN.
Fairprot, N. Y.

ANSWER.

Feed the cow liberally with rich but easy digestible food, and add a dram of nux vomica in her food once or twice daily. There are agents which might bring it on quicker, but it will not be a natural heat.

Enlargement of Bone.

I have a mare twelve years old, which began to be lame about a year and a half ago. Was not very lame at first, but has been growing worse and is now quite lame in off fore leg. I can't find any trouble anywhere except on the point of the elbow there was a small bunch, which seemed like gristle, about an inch long and ¾ inch in diameter. It would move sideways, but not up and down very much.
Carroll. J. W. L.

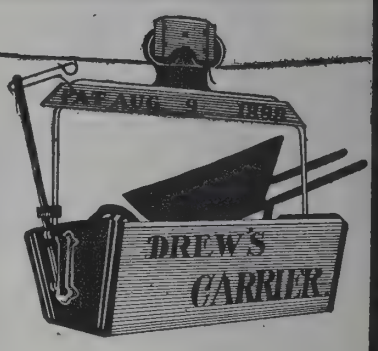
ANSWER.

The enlargement of the bone seems to be the cause of the trouble, not the small bunch, as the enlargement would surely interfere with the action of that joint. The remedy depends largely upon the cause, which cannot be ascertained without a personal examination.

Faulty Secretion.

We have a cow that gave birth to a healthy calf one week ago. She has failed to give any milk, only a little water passes through the teat when she is milked, which is done regularly. J. H. W.
Freehold, N. Y.

ANSWER.



You do not state the condition of the udder. Generally this org .n is hard and

FARM AND CREAMERY FOR SALE

A MONEY MAKER

A rare chance for a dairyman to step into an established business. Will sell farm on which there is a nice little creamery doing a profitable business. For particulars address C. A., Care of HOARD'S DAIRYMAN.

GOODBYE, WHEELBARROW

Every farmer who gets a Drew Elevated Carrier has no more use for the barnyard wheelbarrow. The

DREW ELEVATED CARRIER

will carry the manure from the stables to any point in the barnyard, drop it, return automatically, ready for another load.

It is self operating — it turns curves and switches—dumps its load in yard or wagon. Besides carrying manure you can use it to convey ensilage, feed, grain, potatoes, cans of milk, from one point to another. It works so simple and easy that any man or boy can run it.

THE DREW ELEVATED CARRIER

carries labor off from the farm—it is the farmer's labor and money saver. No trouble to put them up—no trouble after they are up.

It leaves barnyard free from posts—keeps the barnyard clean and free from litter. Get one and

2 Horse Power. READY TO RUN.

Chicago Gasoline Engine Co., 57 N. Jefferson St., Chicago, Ill.

ILLUSTRATION.

The "Eli" gasoline engines manufactured by the Moline Pump Co., at Moline, Ill., bears the reputation of being one of the simplest and best engines on the market. We present herewith a cut of this engine and the following from their catalog presents its good qualities in reasonable manner: "Our experience—first as jobbers, then as manufacturers of gasoline engines—has taught us that the user of an engine wants it just as simple as it possibly can be made, at the same time thoroughly reliable in every respect. Appreciating the demand for an engine simple in construction, one that anyone can understand and run, one that is built on honor, of the best materials and labor, we offer, without fear of contradiction, the "Eli" as the best gasoline engine made. The "Eli" engine has no gears, cams, levers, or any valve mechanism whatever. The only valve is a brass check valve in the air inlet. The atomizer can be taken out, cleaned and replaced in 15 seconds. It will work as well in the coldest weather as in summer. The sparking device can be removed, cleaned and replaced in half a minute. The firing pin is adjustable for wear and when entirely gone can be replaced for a few cents. The crank and pitman are solid steel with heavy bearings. The cross-head principle is used as in the steam engine, thus relieving the piston of all unnecessary wear and friction. The cross-head and crank are entirely enclosed, as shown in cut, thus keeping these moving parts free from dust and dirt. The wrist pin, cross-head pin and slide are automatically oiled from oil placed in the crank chamber." A very large number of gasoline engines are being bought by the readers of HOARD'S DAIRYMAN, and it would be to the advantage of all to send to this company for full information regarding the "Eli".

VETERINARY ADVICE FREE.

Dr. Hess Proposes to Prescribe, Free of Charge, for Animals Owned by Readers of this Publication.

THROUGHOUT November any reader of this publication who has an ailing animal may get the best service of a famous veterinarian free of all charge. This public benefaction comes from the determination of Dr. Hess & Clark to demonstrate to the world the unvarying success of Dr. Hess as a practical veterinarian, and to emphasize his ability to formulate a stock compound of almost universal application.

Thousands of head of valuable stock are lost yearly by the inability of breeders to grapple with the subtler phases of stock diseases, and the greater number of small owners suffer serious loss through ignorance of even the simpler disorders. To all of these comes Dr. Hess (M. D., D. V. S.), ready to freely dispense his knowledge of medicine, gained in the great medical and veterinary colleges and in half a lifetime of active and lucrative practice.

If you have an animal with any kind of disorder, write to-day to Dr. Hess & Clark, Ashland, Ohio, care Information Bureau, enclosing a two-cent stamp and describe your case fully. Also state what stock you have (number of head each kind); what stock food you have used and mention this paper. You will receive in return a special prescription, written from a scientific diagnosis of the special disorder, by this eminent veterinarian. If you want further advice, this also will be fully given.

THIS OFFER HOLDS GOOD ONLY DURING NOVEMBER.

While waiting Dr. Hess' reply, get Dr. Hess Stock Food and feed as directed on the package. You will notice a wonderful change in the spirits and condition of your stock,

Dr. Hess Stock Food is the scientific compound for horses, cattle, hogs and sheep, formulated by Dr. Hess (M. D., D. V. S.). Sold on a written guarantee, 100 lbs. for $5 00—except in Canada and on Pacific Slope—smaller quantities at a slight advance; fed in small dose. For any disease or condition for which Dr. Hess Stock Food is not recommended, the little yellow card in every package entitles you to a letter of advice and special prescription from Dr. Hess at any time.

If your dealer can't supply you, write Dr. Hess & Clark, Ashland, Ohio.

FLEMING BROS., Chemists, 338 Union Stock Yards, Chicago, Ill.

somewhat inflamed in such cases. If so, we would advise to apply hot fomentations to the udder for a half hour at a time, three or four times daily. After each such fomentation, rub the udder dry with the flat of your hands and apply dilute alcohol about 45 per cent strength. Give ½ ounce of Poke root and 1½ ounces of acetate of potash in a quart of water three or four times daily. Keep on milking as often as possible.

Barrenness—Warts.

I have a very valuable Guernsey heifer 2½ years old. Since she is 18 months old has been put to the bull about 8 times, and can't get her with calf.

What will cure common small warts on cow teats? D. G.

Turnip Hole, Pa.

ANSWER.

1. There is evidently an abnormal condition of the generative organs. Have the same examined, and if any such abnormality can be detected, have same removed.

2. Take a sharp pair of scissors and clip them off and touch the parts lightly with a stick of lunar caustic.

Barrenness.

I have a fine Jersey heifer that I bred last spring and in 21 days she came in, and I bred her again and then never noticed her in any more until last Thursday. A week ago she came in again and left her with the bull a half day, and he served her several times. Then she came in again to-day (Sunday, Nov. 1) at 11 days and then I changed bulls. I took her to another bull and he went to her 4 or 5 times while I was there, but I left her with the bull all day.

Oregonia, O. K. E. T.

ANSWER.

See barrenness, this issue.

Unknown Disease.

We have a new disease among our cattle. They swell under the throat, grow poor, and most of them die. Some few got over last spring, but are beginning to swell again now. O. C. C.

Nashville, Ark.

ANSWER.

Please describe your case more definitely. You brief description is not sufficient to form an opinion.

Six Pounds Cotton Seed Meal Not Advised.

I have a grade Jersey cow that freshened the 11th of October. I am feeding 3 pounds of cotton seed meal, 3 pounds of wheat bran and 15 pounds of cotton seed hulls per day. There will be some pasture of poor quality through the winter. She is making a pound of butter a day, and will keep it up within two months of having another calf. I want to know if it will not be best to feed 6 pounds of cotton seed meal and no bran. The cow has shown that she could eat that amount of meal without injury. The cow ran in a good pasture until the day before calving. When she calved, the garget was so bad we could not get more than three quarts of milk a day for the first three days. In a week's time when the garget was relieved, the cow was giving three gallons of rich milk. The cow having had the garget once, will it make her liable to have it the second time?

Cotton seed meal and bran same price, $1.10 a hundred. E. C. H.

Auburn, Ala.

We cannot advise feeding 6 pounds of cottonseed meal per day to any cow, under any circumstances. We suspect that the demonstration showing that this particular cow could eat that amount without injury (?) may have been one of the exciting causes of her trouble with garget. Moreover, 6 pounds of cotton seed meal per day, especially when coupled with cotton seed hulls for roughage, would very likely impair the quality and healthfulness of the product, especially for infants and children. Cotton seed meal, as has been frequently proven, is not a fit feed for calves and pigs, and it is not a far fetched conclusion to say that milk from a cow fed largely upon cotton seed meal, may not be free from similar objections.

Horse Owners! Use

Buff Jersey at Illinois Farmers' Institutes.

ED. HOARD'S DAIRYMAN:—I have been in six counties this fall doing Institute work and while doing the work have been well repaid by what I have seen and learned. In Hancock county I visited a DAIRYMAN reader who has a Buff Jersey silo and has filled it this fall, with a Ross ensilage cutter, blower style, and found it a good machine. I have found the blower to be a pretty dear machine to operate in the past, but am now of the impression that the manufacturers have at last given us a machine that will be satisfactory. At the same time I like the slat carrier. This fall we did our cutting without a single mishap to our 30-foot carrier.

In my trip to the Hancock meeting I stopped off at Burlington, Ia., and visited your correspondent and dairyman, F. M. Parsons, with whom is my oldest son. I found them busy filling seven of my style of silos, with a combined capacity of 1,175 tons. They were doing this with one cutter and two binders. The second binder was required owing to the corn being badly lodged. I visited several of the dairymen in Mr. Parsons' neighborhood and found them all well pleased with their silos. Two years ago Mr. Parsons was the only farmer in Des Moines county who had a silo.

I have this fall put in a traveling Babcock test outfit to illustrate my dairy talks. What a great improvement there has been in these machines over the first ones sent out. I have an eight bottle machine that fits in a neat case and is but twelve inches in diameter and ten inches high. The case is of cast iron, in globe form, and one can take a test on any ordinary table and the vibration is scarcely perceptible. At Bowen, in Hancock county, I took some tests; one of them was 1.2 per cent fat, and on making an inquiry found that the cow had been in the habit of having the calf assist in the milking, but in this case the dairyman tried to get it, but failed to get all the fat, at least.

Last week I was in Scott county at the Institute and took tests. In the meeting we discovered a Holstein breeder and I put up a job on him that created a great deal of merriment. In making some tests I was obliged to fill one bottle with water to balance the other bottles with tests, and when I came to read the tests I held up the bottle containing the water and told the people it was a Holstein cow's milk and did not show a trace of fat. I was taken to be in earnest for a time, and the way the fellows did go for our Holstein friend was a caution. After they had given him quite enough I told them what was in the bottle, which gave them another laughing spell.

At the Cass county Institute I was one of the judges on corn brought in by the boys, and the sweepstakes corn was from a field of 120 acres that was planted with a lister. Listers are not used in this state to any extent, but are coming into favor in some sections, and I think they will prove of value on a majority of the lands in the state, and those who are engaged in the production of seed corn will find them of value, as the ears throughout the fields will be of a more uniform size. I am speaking from several years' experience, having used listers in several states.

I took especial pains to get all of the information possible on the subject of alfalfa, and from all I could gather I do not know any more now as to the success of the crop than I did before the trip. Some reported the crop did fairly well; some did not get anything, while others have tried for some years to raise it and do not yet know whether it will pay or not. It looks as though we have something yet to learn that we have not as yet put in force to make the crop a success.

In one county, I visited a farm devoted to hog raising, and found devices in use that made the care of the hogs a very small matter. There were self feeders for oats and corn, all under good roof, self waterers that gave pure water at all times, and plenty of good pasture was provided a good part of the year. It is needless to say that the man who has this farm is making hog raising pay.

This morning our herd manager took a male pig over to the freight office to ship to a customer. The pig and crate weighed 280 lbs. and the crate 40 lbs., leaving 240 lbs. of pig. This pig, a pure-bred Berkshire, was born on the 14th day of May and ran with the herd of hogs and pigs up to October 10th. He got no especial attention whatever from his babyhood to the present time. His weight indicates he is a pretty good one, and there are others.

Well, Buff Jersey has met, or will meet, his Waterloo. He will attend the Dairymen's Convention at Waterloo, Ia., on the 19th, and tell all he knows of Profitable Dairy Feeds. And by the way, cow feeds are getting in line with breakfast foods these days of progress, a new one is discovered nearly every day. My son is using a new one in Iowa. It is dried brewers grains mixed with molasses, a sort of cow gingerbread. The molasses gives the lacking carbohydrates, and the whole is palatable and nearly, if not quite, balanced. BUFF JERSEY.

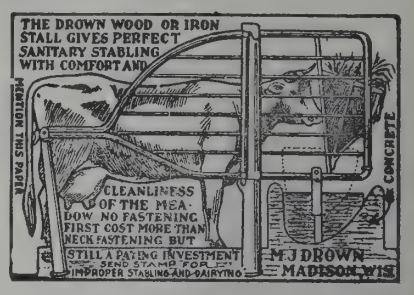
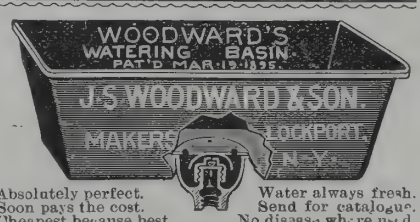
Cause of Cream Ripening.

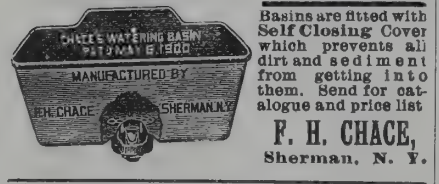


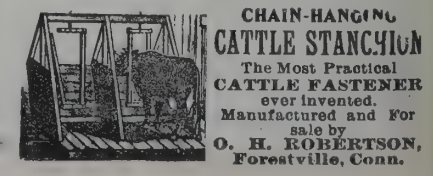
Professor Conn in his work, entitled "Bacteria and Milk," says:

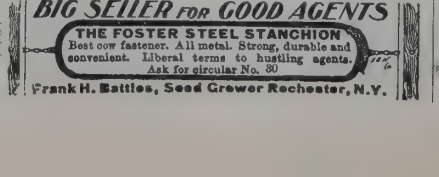
The chief agency in cream ripening is the growth of bacteria. The bacteria of milk collect in the cream and multiply very rapidly at a temperature at which the cream is kept during the ripening. Normally ripened cream contains about 500,000,000 bacteria in every cubic centimeter. From this enormous growth of bacteria it can be easily understood why very pronounced changes take place in the chemical nature of the cream. The organisms not only consume a certain quantity of material for food, but they also produce by-products, either as excretions or as decomposition products, which vitally affect the charater or quality of the cream. While it is true that there are certain chemical ferments found in milk when it is freshly drawn, and while there is no proof that these enzymes may not have a part to play in cream ripening, yet it is generally believed that the part played by these is relatively small, compared with the part played by the organisms. Cream becomes acid on account of the development of lactic acid, and thickens and acquires a peculiar odor because of the presence of decomposition products; such changes are the very ones found to be produced by the growth of bacteria, and thus the general nature of the changes during the cream ripening is quite in accordance with the belief that bacteria are the primary agents in the change.

To the dairyman and the creameryman the matter of chief importance is that of keeping out of the milk or cream such organisms as are injurious to them, such, for example, as are found around stables, due to dust or odors, and also to the odors that might come from quarters in which the products are kept. The great activity of these organisms in reproducing themselves should always be kept in mind, so that their mere introduction is sufficient to undo the work of beneficial bacteria. Where milk or cream is sent to the creamery from the farm, too great pains cannot be taken by the dairyman to exclude organisms of all kinds, good and bad alike, because it is much easier for the creameryman to handle products of this character than it is to handle products in which are found a mixture of flavors.









Dairy Bulls.

[Paper read by Charles L. Hill, Rosendale, Wis., at the Wisconsin Dairymen's Association.]

[Continued from last week.]

Set a post 15 feet long, four feet in the ground and run a wire from the top of this post to a tree or building.

If the wire runs through a hole in the top of the post to a short post close to the ground, you can readily arrange a tightenner with a rod with a nut on the end.

We use about the same plan to give our bull a sun bath, but use a rope running through a pulley at the top of the post, and with a 100-lb. weight which will allow some give and take, but the rope is always tight. I have here a picture of our bull tied on such a runway.

Many bulls tied out in this way will not walk around enough, and if you have such an one, let a yearling bull or two out to scrap with him and both will get plenty of exercise.

Quite an important item of a bull's care that is nearly always neglected, is the the care of his feet.

Don't let them grow like a certain breeder did his bull's feet a few years ago. The Short Course students were there judging and one of them ventured to call the attention of the breeder to the six inches or more of toes the old bull had, and the breeder replied: "Young man, don't you know it is now winter, and of course we keep him on runners."

It is a simple operation to throw a bull with a rope and to saw off his hoofs with a small saw.

Nothing else is as good as a saw, and a good job cannot be done unless the bull is thrown.

The bull should have a ring in his nose about the time he is a year old, and earlier if he is headstrong, and as soon as it is healed he should be taught to lead by it and always be handled with a staff.

A daily grooming will greatly improve his looks, and doubtless do him good.

Do not keep your bull in a foul, dark pen, but, if possible, give him a light, airy box stall, in sight of the herd of cows, and be sure and clean his stall and water him daily.

Do not abuse him, but still be firm with him.

Never fool or play with a young bull, but always make him mind, and then as he grows older never give him a chance to know he can do anything else.

Do not trust him if he is gentle, though you may do as you please about it if he acts cross.

It is always the gentle bull that kills the man.

Careless handling of bulls has cost our state some of her best dairymen and breeders.

You will at this point want to come back to the first question and desire to know what results you can expect by the use of a pure bred bull in your herd.

If you select a bull who has a long line of female ancestors that were better cows than those you expect to breed him to, you may be almost sure that he will work a marked improvement in your herd.

Just how much no one can say, for two full brothers will often, when equally as good individually, prove very different as sires.

Mr. Cogswell, the owner of Exile, speaks of a case of this kind, and the two trotters, Patron and Patronage, was a marked case of this kind.

I can remember of hearing the critics pooh at Patronage and say he was only used because his brother was a great trotter.

Of course, Patron had the best chance in the stud, but Patronage sired Alix, the queen of the turf.

You can ask any of our most successful dairymen in what one thing more than any other lies their success, and they will tell you: "The continued use of the best pure bred dairy sires I could find."

Therefore, in the words of the revered Hiram Smith, "Buy a bull."

DISCUSSION.

Mr. Jacobs: Is it a question that is quite right to leave to a man's fancy, just what breed he should select? While I do not wish to start a breed row, wouldn't it be a better rule to take a breed that is better adapted to a man's business rather than depend on his fancy?

Mr. Hill: Certainly. Perhaps that was not putting it quite right; that he should leave it to his fancy, but after a very little thought, that will be his fancy. He will have decided with study which will be the best breed for him, and that will be his fancy then, and he will look askance at the other breeds, will be looking for flaws in them.

Mr. Gurler: How would it do to feed the bull the same grain feed that you feed the milk cow?

Mr. Hill: It would do. The ration that I mentioned is what I believed to be about the best for the dairy cow as well. I would want him to have a nitrogenous ration and it seems to be an established fact that the best dairymen and breeders today have ceased feeding very much corn silage. Very many of them have impaired the usefulness of the bull by feeding him corn silage.

Mr. Jacobs: Because it is carbonaceous?

Mr. Hill: That is the reason usually given and it probably is the reason. Clover hay I think to be the very best rough feed for the bull that we have today.

Mr. Hyatt: Would roots hurt them?

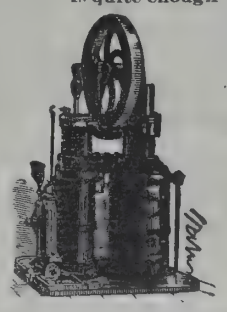
Mr. Hill: No, I don't think so.

Mr. Hyatt: I have been feeding them about fifty years.

Mr. Foster: The gentleman speaks about depending upon the record of his ancestors. Is it a good record to go by when they say a cow made so much butter in a week or a day?

Mr. Hill: Personally I have very little use for any record short of a year. I have known in my own herd so many cows that have made large weekly records and only ordinary yearly records, and, on the other hand, some that scarcely made two pounds of butter a day, at their very best, have made 500 pounds a year.

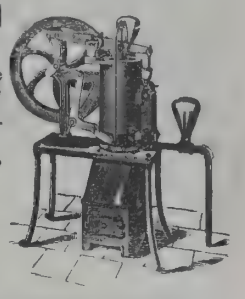
A member: Do you think that a cow that has made a great yearly record will, impair her vitality enough so that it will affect her offspring, and that they will be as prepotent and strong as one that has not been crowded so hard?



Mr. Hill: I think we are in pretty deep water; at least I am. It would be hearsay more than personal experience if I attempted to answer, except in one instance. I did have in my herd a bull from a cow that had been pushed for a large yearly record, and it in no way impaired his usefulness, although his mother was carrying this bull at the time she was making the record; but I do think that with cows that make those great records once a year, it might make a difference. I am just guessing at it, but I think it would in some measure impair the usefulness of her progeny, especially the ones immediately following such a test.

Mr. Foster: In purchasing a sire, how far back do you find you are able to go in the record of that sire in ordinary practice?

Mr. Hill: In the Guernsey breed that I am particularly interested in, about three generations of females is the longest, I think, that you can at this time get the exact yearly record, of the mother, grandmother and great-grandmother, and not that in many cases. If you are assured of two good ones I think you will be getting about all you need ask for. On the other hand, you can learn about many of the old-time cows from breeders, enough to assure you in your own mind



HALF ENOUGH WATER

that they were cows that were capable of making 400 or 500 pounds, which is practically just as much as you would ask as dairymen.

Mr. Hyatt: I will have to differ a little from Mr. Hill in regard to the masculinity of the bull. It may differ with different breeds. I want, when I save a calf for future use as a bull, I want him to look as much like a heifer calf as possible.

Mr. Gillette: Mr. Hill says he thinks it impairs the vitality of the offspring of an animal that has been tested. I would like to call his attention to one or two in our herd. For instance, take old Joe R—— His mother made over 30 pounds in 15 days; back 20 years ago, her mother made some 24 pounds, and right along down. I don't think it has impaired the usefulness of any one of the heifers that we ever got from old Joe.

Mr. Hill: As I said, I am merely guessing at it. Besides, I was speaking not about a weekly record, but a yearly record, in which the cow was forced to do her very best for a long time.

Mrs. Howie: If you were selecting a head for your herd, to which would you give the most attention, the pedigree of the individual, or the individual merits of the animal?

Mr. Hill: I think the pedigree; but I will say in that case I find the individuality, too, generally.

Mrs. Howie: But there are cases where the animal has been forced and sustained a set-back. Would that be the right kind of an animal to put at the head of your herd?

Mr. Hill: No. I said I would by all means see the animal and his mother, if possible. If you cannot, you must depend upon the pedigree and reliability of the breeder.

Mrs. Howie: Suppose you had a cow that made a large record that had a poor conformation in her udder? Would you consider her offspring worthy to be at the head of a fine herd?

Mr. Hill: I tried to make a distinction in my paper between the bull that the dairyman might need and the bull the breeder would want. I am quite a believer, with Professor Haecker, of Minnesota, that too much attention is paid to the shape of the udder. When it comes to the breeders' standpoint I want a good shaped udder on the mother of the bull I am to use, as much as to have a large record; I will have it. But in the case of the dairyman I don't think it is so essential.

Mr. Cobb: I have bred Jerseys for a good many years, but I never have felt that I was competent to take a record and read it, one sent me through the mails, and order a calf C. O. D. In the last four years I have bought two heads of herds, and in buying those I studied eight of his get. I want to have the herd and look over that herd, then after looking at them all and studying the bull, finally I come back to the house and look at the pedigree. I have done that in two instances, and I have met with entire success. In regard to exercise, we have used the tread power for some years. It so happened that we had two of the same aged animals at the same time, and one morning the boys thought it would be a good plan to put the two in the tread power, and the bulls ran off with the tread power and I haven't seen it since. We use a sweep which is a good thing. We turn out a few calves to attact his attention and he gets splendid exercise.

Mr. Hill: I think it is a disgrace that so many of the best proven sires should go to the shambles, for what reason I don't know, unless people get afraid of them. I saw once a bull 7 months old that would put a man to bed for 6 weeks. The old bull is no more vicious than the young one, and even if he is vicious, you can put him in the tread power aud work it out of him. Before I knew as much about that as I do now, we had a bull that became cross at two years of age, and it was impossible for us to handle him, and not knowing about working him, we sold him to a man who said he didn't care how cross he was, and we had to put a rope around his neck and choke him once in a while in order to get him to the station. The man said afterwards that he thought he knew what a cross bull was before, but it took six men and a team of horses to get him home. He drew him right up into the tread power and commenced working it, and he continued to work him, and he said in two months he was as quiet as anything he had. I believe you can work it out of any of them, so they will be glad to keep still. You can have a much better bull by buying an old bull every time.

Mr. Foster: Isn't that way of judging responsible to a great degree for the poor stock we have at present? We have been breeding stock, for instance, for dairy purposes more or less ever since old Noah came out of the ark with the original pair. We have heard all about the dairy cow in Jefferson county, where there are more cows than people, and the average cow produces two hundred pounds of butter a year. Is not this difference of things largely due to breeding from animals judged at their individual merit—upon their shape, in other words?

Mr. Hill: Yes, I think so. Perhaps they haven't even done that much; they have taken the first thing that was at hand, regardless of breeding, or individuality, or anything.

Mr. Goodrich: I heard something said about Jefferson county and I can't keep still any longer. It was 240 pounds of butter per cow that the cows of Jefferson county produced when we made a close investigation of the subject, and we are not going back to 200 pounds per cow, if we know it.

Mr. Foster: I must have seen the report that was printed before you investigated them so carefully.

Mr. Goodrich: It was before we had improved the cows so much.

Mrs. Howie: Mr. Goodrich means before he had improved the dairymen rather than the cows. Mr. Hill, you say that it would not pay for a dairyman to lay stress on the udder or the conformation. What would be your idea of the dairyman who really wished to improve the character of his herd? Should he send to the breeder and ask for the cull of the breed. Would it be policy for a first-class breeder to send out a cull from his herd even to a dairyman's herd?

Mr. Hill: Certainly not. I say only that if a cow has a record of 500 pounds of butter a year, and a dairyman could get one of her sons with that individuality less marked, I would use it in preference to the son of a cow that would make 350 pounds of butter with a good shaped udder.

Mrs. Howie: You would want him strong and with constitution and vigor.

Mr. Hill: Yes, I now am just referring to the udder.

Mr. Favill: I was out buying cows once, and I saw a good looking cow that had a real bad shaped udder, and I didn't buy her. I went around, but I didn't find things as I wanted, and I went back and got that cow. Well, the result was I attended the North-Western Dairymen's Association twenty-three years ago this winter, and I reported that I had a cow that I had milked nine thousand pounds of milk from in ten months, without any special feeding. She had a little grain, but she first came in and went out onto grass and ran to grass until she dried off, and she gave

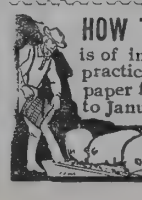
Buy You a Ticket to CROOKSTON, MINN., and call upon

The Polk County Land & Loan Company

For Choice Red River Valley Farms. They pay railroad expenses if you buy from them. A few good bargains.

360 acre farm, 4½ miles from Crookston, Minn., a city of 7,000 inhabitants, and 2½ miles from the State Experimental Farm. This is a photograph of the buildings as they are today: House is 16x24 1½ stories with an L 14x22, and a wood shed in connection 20 feet square, all on a brick foundation. Barn 28x48, with a lean to 16x48, sheeted both inside and out. Two granaries, one 14x80, and the other 14x42. The buildings are all well painted and in very good repair, and has a fine artesian well. Every acre of this farm is under a high state of cultivation, and is well drained by a slight ravine running through the farm merely sufficient for self drainage. The soil is a rich, deep black loam with a clay sub-soil, and in every respect is considered to be one of the best farms in that vicinity. Our price on this farm is $35.00 per acre.

This is a **320** acre farm about 2½ miles south of the city, this farm is quite well improved, has a very good house of about seven rooms, 1½ stories, barn large enough for ten head of horses, also a good granary, pasture and an artesian well, also has a good well at the house, good grove around the building. This is a very choice piece of land for the price $32.50.



160 acres north-east of the city; this is all hay land, and located in a German settlement, the surrounding country is nearly all under cultivation; we consider this a good piece of land for an investment, this could all be put under the plow, if desired. Price $19.00 per acre.

THE VALUE OF CHARCOAL

Few People Know How Useful it is in Preserving Health and Beauty.

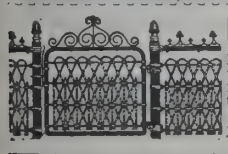
Nearly everybody knows that charcoal is the safest and most efficient disinfectant and purifier in nature, but few realize its value when taken into the human system for the same cleansing purpose.

Charcoal is a remedy that the more you take of it the better; it is not a drug at all, but simply absorbs the gases and impurities always present in the stomach and intestines and carries them out of the system.

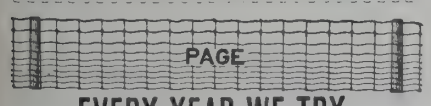
Charcoal sweetens the breath after smoking, drinking or after eating onions and other odorous vegetables.

Charcoal effectually clears and improves the complexion, it whitens the teeth and further acts as a natural and eminently safe cathartic.

It absorbs the injurious gases which collect in the stomach and bowels; it disinfects the mouth and throat from the poison of catarrh.



All druggists sell charcoal in one form or another, but probably the best charcoal and the most for the money is in Stuart's Absorbent Lozenges; they are composed of the finest powdered Willow charcoal, and other harmless anti-septics in tablet form or rather in the form of large, pleasant tasting lozenges, the charcoal being mixed with honey.



The daily use of these lozenges will soon tell in a much improved condition of the general health, better complexion, sweeter breath and purer blood, and the beauty of it is, that no possible harm can result from their continued use, but on the contrary, great benefit.

A Buffalo physician in speaking of the benefits of charcoal, says: "I advise Stuart's Absorbent Lozenges to all patients suffering from gas in stomach and bowels, and to clear the complexion and purify the breath, mouth and throat; I also believe the liver is greatly benefitted by the daily use of them; they cost but twenty-five cents a box at drug stores. and although in some sense a patent preparation, yet I believe I get more and better charcoal in Stuart's Absorbent Lozenges than in any of the ordinary charcoal tablets."

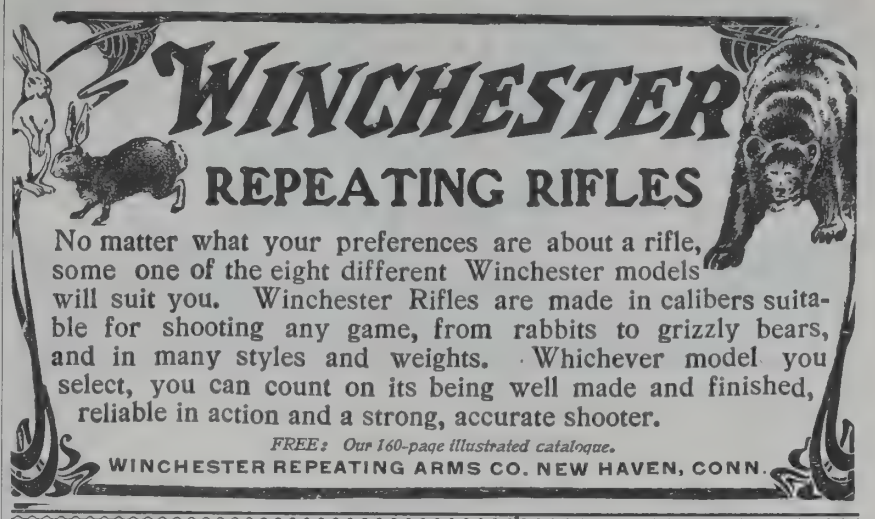
nine thousand pounds of milk. They didn't believe me in that convention; they told me to my face they didn't believe me, but it was a fact just tbe same. She was a cow with a real bad-shaped udder, but she proved a good one.

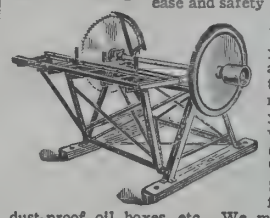
Mr. Hill: A breeder likes to get a sire from a cow that has a good-shaped udder and a large one if he can get it, but some of the very best records are from cows with bad-shaped udders. Take the Jersey cow Eurotas that had a very bad-shaped udder, and still one of her sons sold for $12,000, and she made over 700 pounds of butter in a year.



Mr. Tripp: I want to ask a question that I think will interest many of the farmers in Fond du Lac county, and that is, will it pay the ordinary dairymen of this county, or any other, to purchase and use a thoroughbred Durham bull—not raising the heifer calves?

Mr. Hill: I believe it is a foolish practice. I know it is being carried on, but it is foolish from the fact that you are not going to raise the heifers. I would not use a beef sire on my cows. I wouldn't advise any such practice.

Mr. Burchard; I have kept still almost two days. Here is a case cited by the gentleman and a case put so squarely by Mr. Hill and they are drawing in opposite directions. Now, it is quite a possible thing for a man who wants to raise veal male calves, and dairy female calves, in almost any community in Wisconsin to get the service of both kinds of bulls, and for the very best cows that he has, if he is a wise dairyman, he will use a dairy sire, irrespective of what the progeny may be, in the hope that his cows will occasionally drop him heifer calves that will be worth ten or twenty times as much as he can get for any veal calves he can raise on his farm. We are running these things too much in certain grooves. We think we have only a single track railroad in this business, and it is not true: there are three or four tracks we can use, and I want to enter my protest, although I may be working against my own interests a little, as to the distinction which Mr. Hill makes between the breeder and the dairyman. These breeders are a coterie among themselves and they have lots of fads. They think if an animal is not just up in color or horns or something, so it can be sold for $500 to some other foolish man, that it is not a typical animal and therefore it is not worth having. I don't expect to convert them, but all the same want I to enter my protest every time I hear people talking about this distinction. "Handsome is as handsome does, "and the sooner the earnest breeders of the coutry come to admit that proposition, the better it will be for the country. The gentleman said something about Jefferson county. Now, the trouble in Jefferson county is the same as in Fond du Lac county. There are herds in Jefferson county where every cow will show a profit of ten, fifteen or twenty dollars a year, and there are some foolish people down there who are content to keep herds right along without knowing what they do, and they are not bringing them in three or four or five dollars a year, oftentimes do not even pay for the feed they consume at market prices, and that is the reason this Dairymen's Association has had these cow censuses taken, to try to bring home to the attention of dairymen the importance of knowing what their cows are doing.



You don't need to have Mr. Goodrich or anybody else tell you about this. It is the easiest thing in the world for you to examine your herds for yourselves. There is no man so poor, there is no man so ignorant—if you want to put it that way—but what he can keep a record of each individual cow in his herd, and nine times our of ten, if he will keep that record for a year, he will find he will be saving money to sell off two, three, four or five cows from his herd, and make more money than to keep the whole number. These people that are here today do not need the starter that the State of Illinois is giving. I am giving it to you.

A Member: Where I live, quite a majority of the cows are of Jersey breed, and only a few days ago one of the veterinarians told me that the most of his practice was from the result of this very practice which the gentleman over in that part of the house mentions, using a beef sire on small cows, it was producing a great deal of trouble among the herds. It seems to me that for a dollar and a half or two dollars extra on the price of the calf, it doesn't hardly pay to take so much risk. I think the sooner a man finds out whether he wants milk or beef, the better it will be for him.

WINCHESTER
REPEATING RIFLES
No matter what your preferences are about a rifle, some one of the eight different Winchester models will suit you. Winchester Rifles are made in calibers suitable for shooting any game, from rabbits to grizzly bears, and in many styles and weights. Whichever model you select, you can count on its being well made and finished, reliable in action and a strong, accurate shooter.

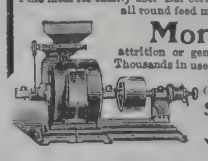
WINCHESTER REPEATING ARMS CO. NEW HAVEN, CONN.



SWEEP GRINDERS $13.75
Grind 46 Bus. Baskets Ear Corn Per Hour
with this Improved Wolverine Ball Bearing, Triple Geared Grinding Mill. **CRUSHES AND GRINDS** ear corn in any condition: shelled corn, rye, oats, barley, Kaffir corn, etc., singly or mixed. Makes coarse, medium or fine feed as desired. Never "chunks" or "hogs" the feed, but produces an even and uniform product. **It is the only sweep mill guaranteed to equal the work of a buhr stone mill.**
IT IS STRONG and is made of the best material money can buy. The castings in the gears are specially heavy and will stand the most severe strain that can be legitimately required of a grinding mill. **The quality is shown by the weight which is 600 pounds.** If it were lighter it would be cheaper, but not so good. **CAPACITY.** This is a stumbling block in the way of grinding mills. We have tested this one under all conditions with all kinds and quality of grains. **Our statement is a guarantee:** If the corn is dry, and the team makes five rounds per minute **this mill will crush and grind 46 bus. baskets of ear corn per hour.** If the team makes three rounds per minute it will grind 28 bus. baskets per hour. Grinding finer, the capacity is less. **LIGHT DRAFT.** Notwithstanding the enormous capacity of this mill it is the lightest draft sweep mill known. **This is so because it is fitted with specially made hardened steel Ball Bearings.** These ball bearings will last a lifetime with ordinary care. We replace any that are found defective or wear out within five years.
$23.25 OUR OFFER. We know that this mill is so good, and so entirely reliable that we will ship it to anyone in the United States with the understanding that if the mill does not do just as we claim, and does not grind more than any two-horse mill made by any other manufacturer of any construction, of any size buhrs; if the mill is not made on more scientific principles; if it does not grind a more uniform quality of feed and if it is not better in every way than any other sweep mill, it may be returned to us at our expense within three days of the time you receive it. Test it in comparison with any other mill and keep the one which is best. **LARGE LINE.** We have eight sizes of sweep mills, $13.75 and up, and thirty other styles and sizes of grinders suited to all grains and purposes.
CUT THIS AD OUT and send it to us and we will mail you our special farm machinery catalogue. Don't buy a grinding mill of any kind until you get it. It is sure to save you money.

YOU ARE MAKING BUTTER FOR THE PROFIT THERE IS IN IT

You must make your butter the best possible if you would command the highest price.

Colonial Butter Salt

AND

Liberty Butter Salt

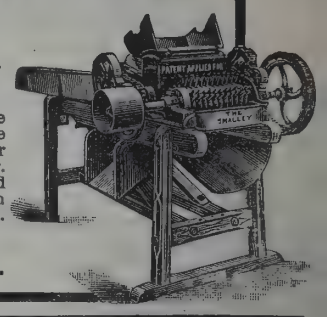
"MONEY MAKERS FOR BUTTER MAKERS"

Are freely credited, by the creameries who use them, with improving the quality of the butter over any other salt, being perfect in flavor, color, and purity, lighter and drier than any other, dissolving more quickly, preventing danger of streaked or mottled butter, while it is safe to work the butter less with these salts than with other makes. Regarding our two brands,

COLONIAL Butter Salt is a light, flaky grain, the lightest for the same bulk that there is on the market. While other makes use a barrel with but a 30 inch stave and a 19 or 20 inch head to hold 320 lbs., Colonial requires a barrel with a 34 inch stave and a 21 inch head to hold the same weight.

LIBERTY Butter Salt is granulated, every grain of the same size and perfectly square; contains one-tenth of one per cent. moisture, so it, as well as the Colonial brand, has the "make weight" feature. It is a little coarser in grain than any other granulated salt, which is a decided improvement, and because of its uniform grain it dissolves evenly and does not leave the butter gritty or mottled.

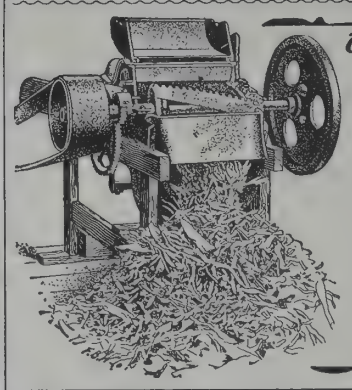
Send for Free Sack



of either or both these brands. Your request on a postal card will assure the prompt delivery to creameries and cheese factories only, without cost, a 56 lb. sack of either or both. Let us know your success with it after trial.

COLONIAL SALT COMPANY, AKRON, OHIO.

CHICAGO OFFICE.....84 ADAMS STREET



THE SMALLEY SHREDDER

HAS NO EQUAL.

It gives fodder the greatest food value, and makes it easier for the animal to masticate and digest. Requires least power; strong and durable; will outlast a dozen of the saw pattern kind. Knives adjustable to compensate for wear. We can furnish snapper rolls to remove all the ears, just the same as a husker. This combination of cutter, shredder and snapper, costs but little more than the ordinary cutter. We also make drag and circular saws, sweep and tread powers, and ensilage cutters with carriers or blowers to reach any silo. Our free catalogue tells all about our goods. Address Box No. H

SMALLEY MFG. CO., Manitowoc, Wis.

The 1903 Shredder Blades

(Patent Applied for)

make efficient shredders out of "Ohio" Feed and Ensilage Cutters. The **New Shredder Blade** is the regular "Ohio" knife with solid integrally projecting bits which cut and tear corn stalks into a nicely shredded condition, as shown in the picture. It makes corn-hay of the fodder.

Shredder Blades are interchangeable with knives on all sizes "Ohio" Cutters. They successfully reduce fodder to the proper condition and do not pulverize the leaves like other styles. **They shred** with the same power, speed and capacity as "Ohio" Cutters, and either the Chain or Blower Elevators handle the shredded corn perfectly. **Speed,** 600 to 700 revolutions. **Power,** 2 Horse Tread up to 12 h. p. Engine according to size. Let us send the 1903 catalogue of "Ohio" Cutters and Shredders. "Modern Silage Methods" 10c, coin or stamps. Manufactured by

THE SILVER MFG. CO., Salem, Ohio. *Established 1854.*

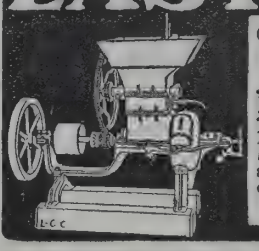
FEED GRINDERS AND COOKERS

Most perfectly adapted to wants of feeders. Feed goes twice as far and makes better beef. Our

Giant Killer Triple Geared Feed Mill

is the fastest sweep mill made. Light running and grinds ear and shelled corn and all grains coarse or fine. Strong and durable.

Northwestern Steam Cooker



leads all others. Return draft, quick steaming, large capacity. Don't buy either mill or cooker without seeing our descriptive circulars. Write for them today.

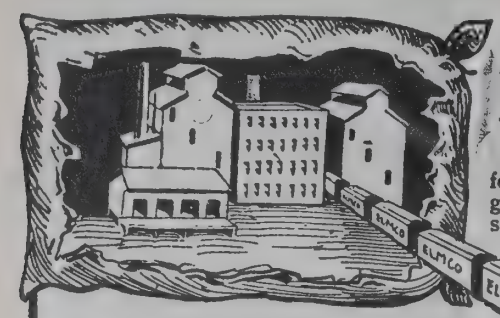
A Great Big Chance

For some time we have been telling you about Tubular Cream Separators. We've tried to tell as many facts about them as we could. But an advertisement of this size doesn't give us room enough to tell you all about them. Do other separator manufacturers tell you how their machines are made?

So!



So we've got out another issue of our paper, "The Separator." It has six pages—newspaper size—is beautifully illustrated in colors—contains many fine half-tones — explains just why the Tubular is so immensely popular—so unquestionably superior to every other separator made —and is brim full of pictures you ought to see and articles you ought to read.

It shows the difference between the right-now popular Tubular separator and the used-to-be-popular "bucket-bowl" machines.

You may have noticed that all separators—except the Tubular—have old style bucket bowls. Have you wondered why? The paper tells you—gives you a great big chance to learn all about Tubular Cream Separators. We would like to send it to you absolutely free. We will, too, if you'll send us your name and address. If you'd like a handsome catalog, as well, ask for No. 144.

The Sharples Co., CHICAGO, ILL.

P. M. Sharples, WEST CHESTER, PA.

FROM MILL TO CONSUMER

You are interested in the strength, purity, uniformity and cost of the feed you buy. Direct dealing with the mill gives you information in regard to these points which you cannot secure when buying feed at random, in bulk.

Once having investigated a mill's product and finding it satisfactory, you can continue your buying from that mill with a confidence and assurance you cannot otherwise feel, providing the mill is reliable.

Buy **ELMCO** Feeds and you know exactly what you get. The Wisconsin Experiment Station has analyzed them, we herewith show the result.

University of Wisconsin, Agricultural Experiment Station, Madison, Wis., November 10, 1902.

	Moisture	Crude Protein flesh forming substances	Ether Extract (fat)
Elmco Red Dog	9.81	18.51	4.73
Elmco Fancy White Mdls.	9.37	18.96	5.87
Elmco Standard Mdls.	9.77	19 13	5.98
Elmco Fancy Bran	10.03	16.71	4.80
Elmco Mixed Feed	10.23	17.90	5.13

The analysis show the feeds to be of superior quality. I have made a careful examination of the feeds and find them to be pure goods, without any foreign admixtures. F. W. WOLL, Chemist.

ELMCO Feeds are made from carefully selected hard Spring wheat, milled for best feeding results. They are put up in 100 and 200 lb. sacks, branded with our trade mark "ELMCO," which guarantees full weight, absolute purity and strength. Quality considered, they are the most reasonable feeds you can buy. They contain more protein and fat for a Dollar than ordinary feeds. Ask us for samples and prices.

Ask your Banker as to our reliability.

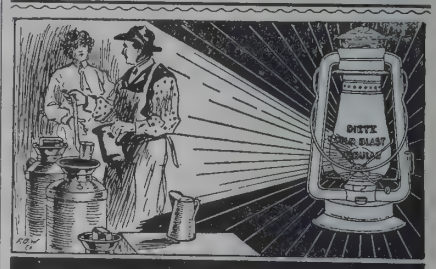
'NEW RIVAL" BLACK POWDER SHELLS.

It's the thoroughly modern and scientific system of loading and the use of only the best materials which make Winchester Factory Loaded "New Rival" Shells give better pattern, penetration and more uniform results generally than any other shells. The special paper and the Winchester patent corrugated head used in making "New Rival" shells give them strength to withstand reloading.

BE SURE TO GET WINCHESTER MAKE OF SHELLS.

Give the Boy that Stays on the Farm a Chance.

President Silvester of the Maryland Agricultural College recently addressed a plea to the farmers of that state that can be considered with profit by farmers everywhere. He said:



Can there be any doubt, at this time, in your minds that a great scientific training in all the branches bearing upon your profession is necessary for the greatest measure of success obtainable in your vocation? Is it true that many men engaged in cropping are obtaining a livelihood, and perhaps saving something by hard work and the strictest economy, who make no pretensions to an understanding of the scientific principles which form the foundation of the advanced agricultural work of the present generation? This condition but emphasizes how much easier it is to obtain a living by agricultural work than by any other of the vocations of man. In any other of the professions or trades the average man, to make any measure of success whatever, must be conversant with modern methods, built upon the latest contributions from scientific research. The doctor, lawyer, engineer, chemist, mechanic or merchant who should seek to build up a profitable business upon methods current twenty-five years ago would soon end in lamentable failure. That farmers who insist upon following the methods of fifty years ago obtain some measure of success, only demonstrates the fact that their vocation is the most favored among the callings of mankind.

The increasing patronage of our experiment stations is yearly reducing to the minimum this class of agriculturists. The dairyman, the orchardist, the nurseryman the trucker, the breeder and feeder of all forms of live stock, and the general farmer are each and all beginning to appreciate the value of the principles of science as they bear upon any special phase of their work. The measure of success in any of these departments is dependent upon the degree to which they use the scientific principles which thread their work. Wherever you find a man in close touch with his experiment station, taking advantage of and correctly applying its teachings, there you find the man making a success of his work. The dairyman who is developing his herd after the improved methods of breeding, who is feeding and caring for his cows by up-to date methods, who is managing the first product from these cows after well-known and well-established principles—here you find a successful dairyman who is in no danger from the competition of the "old-timer" who works on traditional plans.

Subscription in United States, Canada and Mexico $1.00 per year; 6 months 50 cents; 3 months 25 cents.

FOREIGN SUBSCRIPTIONS may be sent through Sampson Low, Marston & Co., St. Dunstan's House, Fetter Lane, London, Eng., or their agents, including the leading news dealers and book sellers in nearly all foreign countries.

All countries in the Postal Union $2.04 a year; not in the Postal Union $2.56. Included postage.

Correspondents must not expect us to acknowledge the receipt of letters containing remittances for subscriptions. The receipt of the DAIRYMAN is sufficient notification that the money has been received. The label on the paper will show date to which subscription is paid. In case of renewals if date on lable is not changed within two weeks after remittance is sent, inform us at once.

Remit by draft on Chicago or New York, or Post Office or Express Order (never by personal check), addressing HOARD'S DAIRYMAN, Fort Atkinson, Wis.

ADVERTISING RATES.

Twenty-five cents per line, (agate measure) 14 lines per inch, each insertion.

Reading notices, 50 cents per line (nonpariel measure) each insertion.

Entered at Fort Atkinson, Wisconsin, as second-class matter.

Breeding and Rearing a Profitable Dairy Worker.

MRS. ADDA F. HOWIE, at the Wisconsin Cheese Makers' Meeting.

MR. PRESIDENT, LADIES AND GENTLEMEN:—While in a northern town yesterday I chanced to take up a Milwaukee paper and naturally being interested in the Cheese Makers' Convention I began reading about your meeting and was given something of a setback when I saw that a woman was to startle the cheese makers by speaking on a topic that the men had heretofore thought belonged wholly to themselves and that some of the members had expressed themselves as displeased with this innovation. Somehow I was not surprised. I had expected a number would object, for if you have ever given this matter attention you will have observed that when a man is putting forth his most commendable efforts in any line of business, he is always glad to receive the approval of some woman, but when he has a sneaking consciousness that he is not doing his best he never courts the advice or criticism of the opposite sex.

Perhaps I ought to make a slight explanation. When I was honored with an invitation from this association to speak here, womanlike I was so puffed up with vanity that I was glad of almost any excuse that would permit me to meet with this distinguished body of men and, then again, it occurred to me that I knew nothing whatever about cheese making. I had heard that the moon was made of green cheese, and yet had never been near enough that celestial orb to dispute it. Still, when I came to think the matter over I concluded there were two branches to the science of dairying, one butter making and the other cheese making, and while I belong to the butter making class, today out of courtesy I will admit that the butter makers are in the kindergarten and that the cheese makers are in the high school grades of this vocation, but shall quite as firmly insist that the foundation of all dairying is the little cow herself, and it appears to me a most fitting subject for a woman to discuss.

In fact, every woman in the land who uses the product, either milk, butter or cheese upon her table, should take an active interest in this most essential part of the business, because if we do not have good and properly cared for cattle how can we expect to produce a wholesome product? I will concede that there has been great progress made during the past few years in the methods of butter and cheese making, and yet I believe that being possessed with the prevailing American spirit, we have been just a little bit too rapid for a permanent improvement.

We have begun by putting the cart before the horse, for while much stress has been laid on the purity of milk and the consistency of curds—I must not get beyond my depth in this—we have heard little about the cleanliness of the cow barn and the care of the cattle that produce the milk from which this valuable product is made, and while I have no intention to apologize for speaking to you on this subject, it may not be amiss to remind you that if you will put your brains into active service you will readily remember that the calf that mother and the girls raised, was always made the best cow

Why was it? Not that mother and the girls were wiser or more determined in their efforts to bring about good results but because there is a tie of sympathy between the human and the bovine mother and that tie is the bond of motherhood; therefore I sincerely believe that a woman is capable of better understanding the conditions and requirements of a cow barn than a man, and I see no reason why she should not discuss—and with profit—these vital questions.

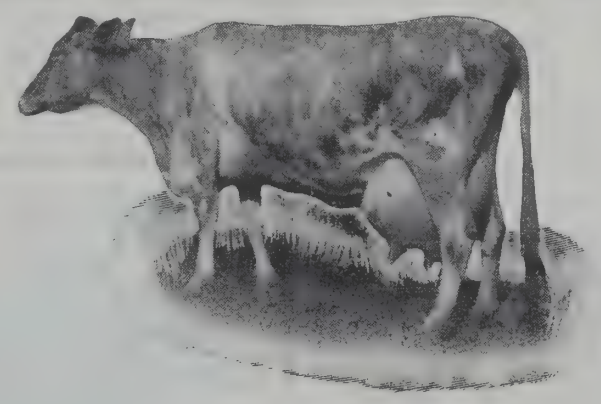
Now, I would not like to give you gentlemen too rude a shock, else I would tell you at once that all the best breeds of dairy stock in the world were developed by woman. Yes, I would emphatically make that statement, and if you regarded it with doubt I would take you to Switzerland where the cattle are held in such esteem that the very cow bells are beautified by the highest art of the engraver, where they are handed down for hundreds of years from generation to generation as a precious legacy. I would go still further and take you to England and Scotland where you might see the most beautiful cattle bred up to the highest state of refinement; again to Denmark and Sweden, to the Isles of Guernsey and Jersey, where it has been recorded of the latter, by a noted historian, that centuries of gentle care, under the management of women had developed this noble breed. And then I would go with you to Holland, for it would be a pleasure to show you those beautiful, sweet, clean barns where the Holland women have brushed and petted and loved and tended the handsome cattle with such beneficial results that the master and his herd may sleep beneath the same roof.

I once spoke of this at an Institute and a farmer jumped up and indignantly said, "You come here to teach us progressive methods, and do you advocate that we should live in a cow barn as they do in Holland?" I looked him squarely in the face and replied, "Yes, that is my ideal, that you should have a condition so perfect that it would not be detrimental to any one to live under the same roof with the cow." And, do you know that I firmly believe that if that man had been obliged to live under the same roof with a good, wholesome cow, he would have been elevated (Laughter and applause). And I feel sure that if some dairymen were compelled to inhabit the same building with their cattle, it would be a good thing; they could not live long, but that would be an extended benefit. (Laughter)

Now, if we make claim to be progressive Americans, as undoubtedly we wish to be, what is the first step to be taken in a course tending towards the betterment of our work? The last speaker told you that we send to France and Italy and elsewhere in order to secure competent instructors to teach the best methods of handling the product. Then why not send to these foreign countries and bring over some of the dairy women, and humbly ask them how to care for cows in order that we may secure the best results. Ask them, never mind if their methods are foolish and mingled with a good bit of sentiment. To the present time the American cow barn has not been overstocked with sentiment. Painstaking thought should be given to the subject before undertaking either branch of this business, such as, which line do you intend following, what breed will be best suited to your needs; and what is quite as important a factor in the elements of success, the barn and its arrangements for the health and welfare of its occupants. Many an up-to-date barn, that has been provided with every known convenience, will be found lacking in its most important features.

I have known of men who had enthusiastically entered the dairy business, had built a large barn, put on four or five lightning rods to show their good intentions and then begrudged the cattle the comfort to which they were entitled. The all-absorbing ambition seemed to have been the saving of labor. Ah, is it the saving of labor that is going to develop a superior class of stock? Why not let the first thought be, what is best for the cattle? because it is necessary to consider the health and welfare of our animals in providing for their wants. A woman would never for an instant think of permitting a cow to lie on a cement platform. Stop and give it thought. A cow with a sensitive, tender udder, that has been developed to her highest capacity in milking; no, a woman would never dream of such an inconsistent way of promoting an animal's usefulness, nor would she put a cow that was expected to freshen within a few months—or at any time for that matter—upon a sloping platform, because from the strained and unnatural position she would have every reason to expect disaster. No, she would not write furiously to the dairy papers for remedies, when by using a little common sense she might be able to avert a lamentable scourge.

I have known of men who wished to build up their herds. They had learned at some farmers' institute that the proper way to begin was by placing a pure bred sire at the head, provided that a herd was composed of native cattle. They would look about, and some breeder would offer to sell one cheap for the reason that it was not quite up to a breeder's standard, but good enough, they would explain, to grade up a herd. Is such an animal good enough? Right here we must use caution. There may be some defects in color or fancy markings, not necessary to the development of a profitable dairy worker, still there is one essential that cannot be overlooked, and that is constitution. It is a positive requisite to the upbuilding of a profitable working herd. Therefore, when selecting a sire, remember he should have an abundance of lung power in order that he may be able to breathe large quantities of oxygen; plenty of heart room; a clear, bright eye, a fine, mellow skin indicative of perfect health, and an altogether vigorous and thrifty appearance.



The same painstaking care should be exercised in choosing the mother. She should have proven her worth at the pail and churn. If both sire and dam are in perfect health, we now have a foundation stock worthy of our earnest thought and most careful attention. And if the mother has received proper care and food, when the little creature comes to the herd it will be a bright-eyed, lively, fearless little thing. Some dairymen of note will tell you to take the calf away at once, but, if your cow is the type I have in mind, she will be of a highly nervous temperament and any excitement caused by such a procedure may bring on serious trouble, possibly a case of milk fever,—and anyone who has ever had that disease in his herd will not wish to see it there again. So, unless the mother's milk be too rich or contains some element harmful to the calf, I would suggest that the calf be left with the cow for three days, and even then let us use humane methods when separating the mother and her little one.

The calf may be put in a pen built across one corner of the box stall, so high that it cannot reach the udder of the cow and yet the cow may lick and fondle it to her heart's content. The mother may now be turned out, but will undoubtedly return in a short time, wild-eyed and terror-stricken, because for years we have bred terror into our cattle, a terror of separation from their little ones. Now, if we are to improve our methods and our stock, let us breed it out. Leave the door of the stall open. When she returns, let her see that no harm has befallen her little one. Speak gently to her that she may be reassured of your kindly intentions. I have known many a cow treated in this manner to quietly go back to her place in the long rows of stalls and voluntarily leave the little one to the care of the herdsman.

The first step in a calf's education is to teach it to drink. I have seen men, real nice men, who belonged to a church and who would not swear only under great provocation, who would plow all day rather than attempt to teach a calf to drink. I have seen such a man take a pail of milk, roll up his sleeves, set his teeth as though he were going to a dentist's chair, and march out to that poor, little inoffensive calf Then he would put the pail down, grab it by the ears, throw one leg over its neck and then ram its head down to the bottom of the pail until the bubbles came up. Is that the humane way to teach a calf to drink? It will kick and struggle. Why, of course; wouldn't you? Yes, you certainly would if your nostrils were down in the milk and you were drawing milk instead of air into your

GUERNSEY COW, HAYES ROSIE, A. G. C. C., 15476.
Property of T. L, AMES, Boston, Mass.
This cow gave in five months 6,872.2 lbs. of milk, and 312.26 lbs. of butter fat.

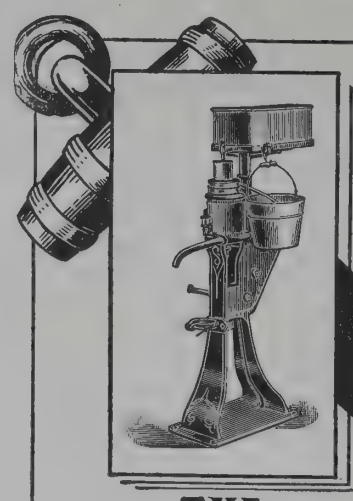
GRADE GUERNSEY COW.
Property of D. S. NEWELL, Bristol, Conn.
By mistake the above cut was printed on page 843 as being the cow Hayes Rosie.

lungs. One should use a little sense.

Now, I will tell you how mother and the girls would accomplish this task. They would get the little one in a corner and pat and pet it, talking so tenderly all the time that it would never realize that it was being managed. Why, I have even seen women who would get a man in a corner and manage him so beautifully he never knew he was being managed at all. (Applause and laughter.) Well, a calf is seldom wiser than a man. A woman will dip her hand in the pail, with the finger tips showing a little above the milk, and while she is talking and stroking it the head is pushed gently down until the lips touch the milk and grasp the fingers. As soon as it begins drinking the fingers are withdrawn. Perhaps the head may come up and the same process be repeated. A little time and patience will be required, and I have known them to drink after the first lesson; again, it may take several. But humane methods from the start will pay big dividends in the cow barn. Begin with the foundation stock. One cannot pet or love them too much. It is an essential part of their training.

Until a calf is three weeks old, it should be fed three times daily, two quarts of clean, warm milk each time,—98 degrees is the proper temperature, At the end of the first week a small portion of the milk may be skimmed, and by the end of the second or third week, the entire amount may be skimmed. One should not think that because the milk is skimmed the calf would be able to take a greater amount. By skimming, the butter fat alone has been removed. There yet remains all the casein and other solids which will amply supply the bone and muscle forming elements necessary for the development of a dairy animal. After three weeks, the six quarts of milk may be divided into two feeds a day. In bringing the milk up to a proper temperature, the can should never be set directly on the stove for fear the milk may become scorched. Plunging the can in hot water is a better means of attaining the right degree of heat. It is not necessary to ever raise the quantity of milk, for as the calf grows older and requires more liquid, water may be added. However, a larger amount of milk may be given if a little is cautiously added from time to time. From the day of its birth it may be given clean, bright hay. The hay should not be thrown in the pen where the calf may walk over it until it becomes soiled and unfit for food, but should be put in a rack where it will be kept fresh and clean.

Another very important thing in raising a profitable dairy worker is plenty of sunlight and pure air. The calf pens should be so arranged that they may be flooded with sunlight. They must also be kept dry and clean. A little fresh bedding, scattered over a wet, filthy surface, is not sufficient, for the moisture beneath will prove harmful in the extreme to the rugged constitution that should be the foremost object in calf raising.



At the end of the second week a little box may be placed in one corner of the pen in which a small quantity of whole oats or bran may be put. After the calf has finished its milk, a little of the grain rubbed on its nose will soon teach it to find the box. We now have it in a thrifty condition, and if care is exercised as to the temperature of the milk, the cleanliness of the pens, the sunlight and ventilation, the calf is well started on the road to a course of future usefulness.

The fall and summer calves are left in the stable until after the first flush of grass is over. We do not want to put them out when there is too much succulence in the grass, and then if there is not enough pasture they should have a soiling crop. When a heifer is from five to six months old, take away the grain. Make her satisfied with roughage. But give her enough roughage. Be sure she has good, pure water. You may give her a little from the start. The old Connecticut rule is, 60 quarts of water a day for a cow at flush of milk. The spring and summer calves are kept until September, then are put on pasture.

Now, if a heifer is thrifty and well and has grown naturally, we do not want to force her, just a steady, natural growth. She should become a producer at an age of from 20 to 30 months. I should prefer to have her about 23 months old. Three months before she is about to freshen, give her extra care; begin and grain her gradually at first, then until she will take with profit, all that she can eat readily. Begin to groom her in order to stimulate the circulation. You may go to hundreds of farms and the horses will be found sleek, but the cattle will stand day in and day out in their stalls with never a brush or curry comb touched to them. And it is far more essential for our cows to be clean than our horses, because we are to eat the product of the cow.

This heifer should be put in a stall, should be made to feel her importance. Of course, she has never been curried with a milk stool, has never been touched up a bit with a pitchfork. You have never done any of these things if you are going to have a first-class worker. Make her think she is of some consequence. Brush her and curry her. Why, I have known men, horsemen, when they were going to drive a horse they would give it every advantage possible for freedom of limb and muscle. They would select the finest harness, carefully adjust every buckle, secure the lightest sulky they could get, and even make the driver diet that his weight might not not hamper the horse's speed; and we dairymen, who should give a cow every advantage, should give every freedom of muscle and limb and body and head, in order that she may do her best work and produce a wholesome product,—what do we do? Well, you do not do it, and I do not do it, but I have known people to put a cow in a stanchion with her head firmly held like a criminal in a stock. Now, if you have ever been out into the pasture and noticed a cow lying down in a natural position, you will have seen her resting with her head upon her side as nature intended that she should. "We can care for them better in this way, it only takes a minute," is the excuse given by some dairymen. That is where we make a mistake; it only takes a minute, and we are throwing away the greater part of the profit because we are not willing to give the time and attention necessary to insure the best results. We are not only doing that, we are doing worse. We are ill treating the animals that God has given us for our profit and pleasure.

When this heifer is in the stall, brush her and groom her and pet her, handle the udder to familiarize her with the milking process, and then, when she freshens, there will be no heart-rending "breaking-in," there will be no kicking and stamping about the stall. She may look about and step about when she hears the milk falling into the pail, but if you give her a kindly, reassuring word, in just a day or two she will stand chewing her cud like an old cow. Now, I beg of you, go to the old country and bring back another method, that is, of milking three or more times a day. I have heard Americans say, "It is all I can do to milk twice a day." But cannot you see that if you had left the calf with her, from time to

CHILD'S PATENT

MILK BOTTLE FILLER

Instead of buying something that will soon be used up, get an article that will lighten your labor every day for many years. Every progressive dairyman wants the easiest, cleanest and best bottling machine on the market, if he can get it at a reasonable price. He will find on investigation that

CHILD'S PATENT MILK BOTTLE FILLER

answers all these requirements and besides will save time, money and labor. IT WAS AWARDED THE ONLY PRIZE FOR AUTOMATIC MILK BOTTLE FILLERS AT THE PARIS EXPOSITION OF 1900 and has remained ever since the best machine on the market. It possesses many labor saving devises that are fully explained in our catalogue. Write for it today.

J. S. BIESECKER, 59 Murray St., New York City

Get our Prices on Dairy Supplies before ordering elsewhere and Save Money

time it would have relieved the udder? You have bred her to give a large flow of milk; you have fed her for the same purpose, and now that she gives it, be humane enough to take it from her and not allow her to suffer. The first milking season should be prolonged up to the second freshening if possible. Before she freshens for the third time, let her go dry for two months, then when she freshens you have a cow that will, as a rule, prove a profitable dairy worker.

Let us give more conscientious thought and care to the breeding and development of our dairy cattle. We Americans are willing to spend large sums of money in importing cattle, but we are unwilling to give the time and thought necessary for their proper care when we have them here. We secure the finest types of the fancy breeds which should furnish us good foundation stock, and, with the vanity that is so prevalent among Americans, our ambition is to take sweepstakes at the fair, We stimulate and cram them and work their udders until their usefulness is totally destroyed. They are unfitted either to reproduce their like or as milk producers, and then we step out of the ring with a few paltry blue ribbons that have been won by torturing the life out of these helpless creatures. We have failed to improve them in any respect, and we take our money and go back and buy more.

Boys, Stick to the Farm.

ED. HOARD'S DAIRYMAN:—The agricultural situation is yearly becoming more serious on account of the scarcity of help. In all parts of the country wages of farm help have advanced and it it is difficult to get help enough at any price. A report comes from Iowa that during haying they paid $3 per day and 35 cents an hour for time in excess of ten hours. When grain was ripe in Minnesota, travellers report seeing many binders running, but generally there was no one shocking the grain. In Kansas, thousands of acres of fine wheat were never harvested on account of the scarcity of farm help. For the same reason, in some parts of the country, it is difficult to sell a farm at any price.

What are we doing to improve the situation? Nothing whatever, and now thousands of boys reared upon the farm and disgusted with farm work are preparing to start for the city. They may find work of some kind for the present, but if we may judge the future by the past, sooner or later there will be a period of depression and hard times, when thousands in the cities will be thrown out of employment and will become beggars.

It is difficult to reach these boys through the medium of cold type. The time may come when special institutes for boys will be held in every county. Some enterprising and energetic men may try them in a few counties this winter. To draw the boys out we must amuse, as well as instruct. There is plenty of musical talent in every county; school boy orations and declamations could furnish another part of the entertainment; and some farmer, who is a good speaker, can tell the story of his success, and if I can render any assistance, will accept invitations to speak upon the subject, "How to Bring up Boys so that They Will Like the Farm.

I have made this a special study for years, and when I have put my theory in practice have been successful. A few years ago a man living in Evanston, Illinois, sent me two boys to spend their summer vacation, and wanted them to learn to work. In these few weeks the boys learned how to do many kinds of farm work and, to my astonishment, could, before they left, milk as well as myself.

For four summers I have been training two boys from Chicago, who never did any work till they came here. Now, they are as good farm help as any one could wish and helped us handle our big hay crop and then went into the corn field with their hoes and worked with me for a week, subduing the big weeds which had sprung up during the wet weather.

What was my own boy of seventeen doing at the time? He was at work alone, slashing down the bushes that had grown up along an old rail fence and setting posts for woven wire—a most disagreeable job. In regard to these two city boys, I might add, if any of the neighbors wanted help about harvesting, stacking or threshing, they were always ready, provided I could spare them. With them work seems to be a pleasure, and it is also a pleasure to hire such willing workers.

N. B. WHITE.

Oconomowoc, Wis.

Cows that are Thieves.

"If the 'man behind the cow' in Kansas would do his part, no unprofitable animal would masquerade under the fictitious appellation of "milch cow," and she would either go to the butcher's block or be made to return a profit by more intelligent care and management," says Secretary Coburn in the last quarterly Report of the Kansas Board of Agriculture. "It passeth understanding why theft by a cow should be tolerated more than theft by a human. In effect, the result to the loser in either case is the same. Our government has found it wisdom to study and establish far-reaching methods for the detection and the repression of the latter; and by the same token why should our farmers and dairymen be less vigilant in regard to this possible proclivity in their cows—beasts described as dumb, yet outwitting their owners? So long as cows of this class are permitted in the dairy herd, so long will there be dissatisfaction and failure. Improvement is the route to success, whether by breeding, better management, or other way, and intelligence in our cow men is the power that will force advancement in the right direction.

"Dairying has come to be one of the most important factors in Kansas agriculture, and, rightly conducted, is one of the surest money makers of our varied industries. It is incomparably more rational than any one-crop system, or even general farming, as its practice tends to rotation of crops, maintains or increases the fertility of land, and affords steady employment with returns remunerative according to the brains mixed with the business."

When to Cut Cow Peas for Hay.

Will you kindly let me know at what stage of their growth cow peas should be cut to make hay?

A. H. D'C.

Jamaica, W. I.

The peas should be cut for hay when the pods begin to ripen, or just when the lower leaves begin to fall. It may be that in a climate like Jamaica the falling of the leaves cannot be depended upon, in which case cut when the pods are well filled and the peas begin to harden.

"ADVERTISEMENT."

BAD HABITS.

Improper Food Often Leads to Tobacco and Drink.

Improper food creates abnormal tastes and there are many cases on the medical records where the liquor habit and tobacco habit has been caused by wrong food and have easily been cured by the use of the scientific food Grape-Nuts which so thoroughly nourishes and rebuilds the nerves that they stop the cry of stimulants.

A business man says: "For 30 years I smoked on an average of 10 or 15 cigars a day and then my nervous system collapsed and I had about made up my mind that it was all up with me for I had tried many times to break off from the tobacco but it always failed.

"Last May I was so run down I only weighed 111 pounds and I realized that I must stop smoking and stuck to it for about 10 days but was so nervous and out of sorts my family told me I had better go back to smoking as it was impossible to live with me. It was just about this time my wife brought a package of Grape-Nuts on the table one morning and as I could eat nothing else she induced me to try a little of that. So I took a teaspoonful of it and strange to say it tasted good and by the time I had it down I knew it had gone to the right spot so I took some more and it was the first food I had relished for weeks.

"So I kept up the use of Grape-Nuts and as my appetite came back added other foods and I am now back to my old weight of 133 pounds, never felt better in my life and strange as it may seem I have no further craving for the tobacco and I thoroughly believe that only the courage and ambition I got out of the food Grape-Nuts has given me the strength to quit smoking. If everyone knew the power of this wonderful food you would not be able to build a factory big enough to supply it." Name given by Postum Co., Battle Creek, Mich.

There's a reason.

Look in each package for a copy of the famous little book, "The Road to Wellville."

WILL IT PAY YOU TO TAKE HOARD'S DAIRYMAN?

W. H. Jenkins took a census in 1901 of 50 farmers who were patrons of the creamery in Montrose, Pa. Twenty-five of them read dairy papers; twenty-five did not. The twenty-five who did read dairy papers averaged $50.23 per cow for the year. The twenty-five who did not read averaged $32.95. Here is a difference of $17.28 per cow. Did it pay the twenty-five to read? Did it pay the other twenty-five not to read? That's not all. Those who did read averaged a profit over cost of food of $15.06 per cow. Those who did not read averaged a profit of 66 cents. Is not that dairy farmer standing greatly in his own light who will not pay 2 cents a week for Hoard's Dairyman? These are hard facts worth thinking over.

COMING EVENTS.

Vermont Dairymen's Association, Burlington, Jan. 5-7, 1904.
Indiana State Dairymen's Meeting, Plymouth, Dec. 10-11, 1903.
Minnesota Dairymen's Association, Fairmont, Dec. 15-17, 1903.
Illinois Dairymen's Association, Greenville, Jan. 5-7, 1904.
Wisconsin Cheese Makers' Association, Milwaukee, Jan. 6-8, 1904.
Ohio Dairymen's Association, Columbus, Jan. 27-29, 1904.
Wisconsin Butter Makers' Association, Feb. 2-4, 1904.
Maine Dairy Convention, Foxcraft, Me., Dec. 2-3, 1903.
New Jersey Agricultural and Dairy Convention, Trenton, N. J., Jan. 14 15 and 16.
Eastern Ontario Dairymen's Convention, Belleville, Ont., Jan. 5, 6 and 7.
Missouri Dairymen's Meeting, Clinton, Dec. 8-10, 1903.
Washington Dairymen's Association, North Yakima, Dec. 29-31.
Massachusetts Creamery Association, Greenfield.
Connecticut Dairymen's Association, Hartford, Jan. 20-21.
Oregon's Dairymen's Association, Corvallis, Dec. 15-16.
Wisconsin Buttermakers' Meeting, Eau Claire, Feb. 2-4, 1904.
Wisconsin Dairymen's Convention at Plattesville, Feb. 10–12, 1904.
New. York, Dairymen's Association, Ogdensburg, Dec. 8-11.
New Hampshire Dairymen's Association, Keene, Dec. 1-2.
Penn. Dairy Union, Lock Haven Dec. 2-3.

THE annual convention of the Wisconsin Dairymen's Association will be held at Platteville, in Grant county, February 10 and 12, 1904. As this will be the first meeting of the association in that part of the state it is expected there will be an attendance that will fully tax the capacity of Platteville's elegant and commodious opera house. The invitation comes signed by a committee consisting of the Mayor of the city and eleven of its prominent and progressive citizens, which insures active, local support and this in turn insures a good convention.

Platteville is easily reached from the east by the Chicago, Milwaukee and St. Paul Railway and from the north and south by the Chicago and Northwestern line from Madison to Galena.

TO INSURE THE KEEPING QUALITY OF MILK.

This question is submitted by a subscriber, who for reasons not stated wishes to have his identity and location held in confidence. The problem is to deliver the milk of one day by rail to a customer the next forenoon as fresh in taste and appearance as when drawn from the cow. We believe that this can be done and that the only conditions to success are cleanliness and cold, but cleanliness in these days means something more than the absence of visible dirt. It means absolutely sterile milk vessels, and something more than ordinary care of the cow and her surroundings.

Before commencing to milk, the udder and flanks of the cow must be thoroughly brushed and carefully dampened so that no hairs or dust or dirt can fall into the pail; the milker must then carefully wash his hands and put on a clean milking suit. The milk pail should not only have been washed clean, but should also have been effectively scalded out with absolutely boiling water or live steam, or baked in a hot oven. This pail should have a cover with a raised opening four to six inches in diameter, with a strainer and layer of absorbent cotton.

Immediately after milking, remove the milk from the stable and set in cold water to cool, and while cooling keep it well stirred. When cooled, fill into sterile bottles, seal and keep at a temperature of 50° F., or less. If boxes with compartments for ice can not be had, wrap each bottle with three or four thicknesses of flannel or other thick cloth well wetted. If the customer on receiving this milk, will continue to keep it at a temperature of 50° or less, no perceptible change should take place in the next 24 hours.

We mention a temperature of 50° out of abundant caution, but it is quite possible that any temperature below 60° would suffice.

SOME REASONS WHY.

The constant effort on the part of HOARD'S DAIRYMAN to stimulate the habit of more and better reading, more careful observation and study, by the dairy farmer, brings us a very interesting amount of correspondence. With all our conceit and boasted progress as a nation, we are very far yet from handling our farming operations as intelligently as we should. It will be remembered that a large body of the leading agriculturists of Germany visited the United States last summer and made a close study of our farms and our farmers. They spent a half day, nearly, at the HOARD'S DAIRYMAN farm, and we were very much impressed by the remarks of one of the leading men of that company. He said privately to us:

"You have a wonderful country in extent and natural fertility, but I can see that your farmers are not making half the profit they should make, nor that they would make if they were better educated in their business, and besides that, because they are not as well educated as they should be, they are rapidly destroying the fertility of their farms."

That was the judgment of one of the best posted and most successful farmers in Germany. Is it true?

In the opinion of the DAIRYMAN it is one of the truest statements ever uttered concerning the American farmer. There are three main points in that statement:

1. The serious lack of practical farm education. This keen student of men and farming could see all that at a glance, as he looked into the loose, slip-shod methods employed on American farms. The evidences of a lack of real serious study and cultivation of the mind, on the part of our farmers, was apparent everywhere. He saw that there was altogether too few farmers who believed in brain farming as well as hand farming. He could easily see that in the small number of farmers' sons who attended our agricultural schools; in the almost total lack of the teaching of the elements of agriculture in our common schools; and finally in the too few books and papers relating to agriculture which are read by our farmers.

2. The small profits obtained from the American farm in comparison with what they should be, and would be if the farmer had a desire for wider and better education in this thing we call farming. He was astonished that so many of our farmers were so contented to drag along year after year with poor, wasteful methods and such starvation results. He could see, what they do not see, that *net profit* in farming comes from good thinking, good management based on discriminating intelligence, and not on mere hard work.

He could see, what so many do not see, that to acquire this needed education and intelligence a farmer must train his mind in habits of reading and study just the same as men in other professions have to do.

(3) The waste of fertility. This is the great, damning sin that must be laid at the door of the American farmer in his destructive march across the continent from the Atlantic to the Pacific. All the way from New England to California can be seen the result of this brainless, stupid dealing with the original fertility of the finest country the sun ever shone on. What caused it? There can be but one answer. Men, like the man who wrote us the following letter, caused it:

"MR. HOARD:—I want you to stop sending me your paper. I know all I want to know about cows now. You are all the time talking about our reading more. There is too much reading. The more the farmers read the worse they are off. When the country was new we had no papers and we had splendid crops. Where are we now? We are dried up like a bone one year and drowned out the next. I was born on my farm, and it grows harder every year to raise a crop. Reading won't help me,"

Indiana. S. L. GRAHAM.

There is a pathos in that man's story that represses harsh criticism. The German farmer saw it in his travels across the continent, in thousands of once fertile farms, now lying shrunken, ragged and shrivelled; in the once magnificent forests cut off, and the streams dried up at the least approach of drouth; in the land robbed of a once splendid fertility through the ignorant management of men who sneered at books and papers and despised all knowledge, and now, without the intelligence to understand what they read, they cry: "Reading won't help me."

It is because we see the situation as the German farmer did, that we constantly preach the saving grace of more intelligence in dealing with this thing we call farming.

THE DAIRYMEN AT THE ST. LOUIS WORLD'S FAIR.

Several visits to the St. Louis World's Fair during the past year, has convinced us that the dairy farmers of the United States and Canada are woefully behind in their ideas and convictions of what this greatest of opportunities means to them.

In the first place, as a whole, the Louisiana Purchase Exposition will exceed many times all previous attempts to bring together the men and women of the whole world and the work of their brains and hands.

An idea of its size as compared with the Chicago World's Fair in 1893, may be gained from the following statement: The Chicago Fair occupied 400 acres. The St. Louis Exposition occupies 1300 acres. And so it goes in the size of the great buildings and the efforts that will be pnt forth, by the peoples of all the earth, to fill them with every conceivable form of human achievement,

At the Chicago World's Fair the first attempt was made in a large and adequate way to determine the dairy capacity and economy of various breeds of cattle. Great as was that opportunity, to secure in this way solid and authoritative ideas and judgments for the guidance of men, it was rejected by the leading breeders of Holsteins, Ayrshires, Devons Red Polls, and Brown Swiss, and only the Jerseys, Guernseys and Short-horns participated. But partial as was the ground covered, the harvest of real practical and scientific knowledge that followed was a rich one.

Then followed the Pan-American at Buffalo, at which there was a practical dairy contest for six months, between the following breeds of cattle: Jerseys, Guernseys, Ayrshires, Holsteins, Short-horns, Red Polls, Brown Swiss and French Canadian, with a selection of five cows each. Every well demonstrated method known to dairy science for determining the truth was applied, and the result is known to our readers.

Now these two great public tests, imperfect in rules and procedure as they may have been, stand out in history as the two greatest land marks for the guidance of human judgment, in many ways, concerning the dairy qualities of breeds of cattle. In them lie a great mass of proved facts for the instrnction of men on all questions relating to the breeding, feeding and general management of cows.

But here comes the St. Louis exposition, the greatest of all, with enhanced opportunity for the demonstration of needed truth, with the most liberal of offers on the part of its managers for the further quest of knowledge in this direction, and how is it received?

Only the Jerseys and Short-horns are making preparations to enter the test. All of the other breeds, as we understand, have rejected the opportunity. What is this, on their part, but a blank confession of cowardice, and lack of faith in their cattle?

At Chicago the Holsteins and Ayrshire associations both refused to enter the test and they suffered sorely for it, subsequently, in public estimation. At the Pan American the Holsteins, Jerseys and Ayrshires were only saved from the disgrace of non-representation by the individual enterprise of some of the breeders of these cattle who had more pride and faith than had the Associations that represented them. We are informed that at St. Louis the Holstein Association went so far as to rent a farm and make preparations to worthily enter the contest with their cattle, and then backed out, without explanation to the world or their people.

And the American Guernsey Cattle Club, with the noble record of a noble breed, has suddenly lost all courage and we will see no Guernseys in the St. Louis Test. And so it is with the Ayrshires, another grand dairy breed.

In the estimation of HOARD'S DAIRYMAN the situation reflects no credit on the enterprise or faith of the Holstein, Guernsey, Ayrshire or Red Poll cattle Associations, or on the merits of their respective breeds. Only two breeds dare enter the ring, the Jerseys and Short-horns. The spectacle is not an inspiring one. The Sioux Indians had a chief who was called "Man Afraid-of-His Horses," and he has ceased to win respect of even an Indian.

FACTS *versus* CONCLUSIONS.

Shall the Small Dairy Cow be Discarded?—A Wisconsin Bulletin Reviewed.

Bulletin 102 of the Wisconsin Experiment Station, recently issued, the joint production of W. L. Carlyle, late Professor of Animal Husbandry, and Professor F. W. Woll of the Division of Chemistry, is entitled "Studies in Milk Production" and purports to be "Based on Records of Cows in the University Dairy Herd, 1898-1903." It is unfortunate and much to be regretted, from every point of view, that a publication representing so much labor and dealing with such important problems, should have gone to press without more careful editing than appears to have been given this bulletin.

There is much in it that deserves commendation, many wise and proper things said, and sound deductions made, and it is, therefore, all the more surprising to find some judgments pronounced and some opinions expressed so utterly at

variance with the facts recited. Indeed, one of the peculiar features of this somewhat remarkable bulletin is the apparent nonchalance with which it contradicts and controverts itself.

We have no inclination to go into all the details, but we feel compelled to protest against Prof. Carlyle's unnatural and unscientific division or classification of the animals comprising the herd, and the unwarranted condemnation of the small dairy cow.

In the selection of the herd, cows were purchased or obtained by donation, to represent the dairy breeds proper, and also the so-called dual-purpose type of cow, and then the cows representing the dairy breeds were subdivided, those of "extreme dairy type," otherwise described as "small, much refined and delicate dairy cows with a very spare habit of body," were assigned to Class A, and the others, characterized as of "large dairy type," to Class B. Class C was made up of the "dual-purpose type." Our observation is, that there are large cows of the extremest dairy type—as that expression has been heretofore used and understood—and that refinement, delicacy and spare habit of body may be as pronounced in the large dairy cow as in her smaller sister. In other words, dairy type ignores size, and is exclusively concerned with conformation, temperament and the correlation of parts in the individual animal, irrespective of avoirdupois or breed. We do indeed sometimes discuss the relative merits of large cows and small cows—or rather, as in this instance, the unprejudiced reviewer must sometimes point out the errors of those who withhold just appreciation of the small cow, or condemn her altogether, and show that size is not an important factor in determining the capacity of a dairy cow for profitable production.

True it is that by making this special classification of the herd in his charge, and by combining the average annual net profits of the cows with more than one-year records, with those of the 18 cows with records for one year only, Prof. Carlyle is able to show that the "large dairy type" cow averaged $2.05 more annual profit than the small, "extreme dairy type" cow. Thereupon he says, not only that the large dairy type cow "is clearly in the lead as an economical producer of milk and butter fat" (cows were credited 20 cents per pound for butter and 15 cents per hundred pounds for skim milk), but expresses the opinion that cows weighing 1,000 lbs. or more will be found most satisfactory for the dairy farmer, apparently unmindful of the old adage that the appearance of one swallow is not a certain indication of the arrival of summer.

If it was true, which it is not, as we will show in this paragraph, that the cows in this particular herd, classified as of "extreme dairy type," fell $2.05 below those of large dairy type," in average annual profit, it would have been eminently proper to call special attention to such a circumstance, and set on foot some inquiry as to whether this was due to size or other conditions, but it does not justify such a sweeping condemnation of the whole class, especially as it is shown that some of the cows in that class were of superior merit. The whole truth in regard to the performance of this herd, so far as the bulletin discloses it, is that there were 78 yearly records, that the cows of the condemned "extreme dairy type," 14 in number, furnished 26 of these records showing a total net profit of $1,-152.23, an average of $44.31 profit each year, while the overpraised cows of "large dairy type," 12 in number, furnished 25 of the yearly records with a total net profit of $1,100.43, which is an average of only $44.02 per year.

If these figures are sufficient to prove anything, it is that there was no appreciable difference, in profitable production of milk and butter, between the groups of cows in that herd classified as being of "extreme dairy type" and "large dairy type," and hence, that the division of the dairy type cows into two classes was unwarranted, unscientific and unproductive of any good. What the dairy farmer needs, in this matter of classification, is information as to the peculiar features, if there are such, which distinguish the more profitable cows from the less profitable ones. It is patent that size is not a dominant factor, for there were the widest variations between cows in the same class, whereas, taken by groups, one group compared with another, when classified by size, there was no variation worthy of mention. It appears, therefore, that the matters of moment were overlooked, and emphasis placed where it did not belong. This is not denying, if the records of the Wisconsin University Herd show that cows weighing 1,000 lbs. or more were more profitable than cows weighing less than 1,000 lbs., that such evidence would be pertinent, even if not conclusive.

But as we have already said, the bulletin under consideration is not consistent with itself. Not only is the main table, giving a summary of the herd for four years, compiled on an erroneous basis, and the classification of the cows into "extreme dairy type" and "large dairy type" misleading, but the conclusions drawn from such premises are emphatically negatived on subsequent pages, where the cows are grouped according to live weight.

Of the 38 cows whose records for one or more years are given, eleven, 8 of them described as Jerseys and 3 as Guernseys, weighed less than 900 lbs. (average 829); twelve, 4 Jerseys, 5 Guernseys, 1 Holstein and 2 Shorthorns, weighed from 900 to 1,100 lbs. (average 1,004); and fifteen, 9 Shorthorns, 4 Holsteins, 1 Guernsey and 1 Red Poll, weighed over 1,100 lbs. (average 1,199). In this division or grouping no account was taken of type or conformation—even names of cows are not given. Presumably the Jerseys, Guernseys and Holsteins were of more or less pronounced dairy type, and we have the authority of the bulletin for saying the Short-horns fairly represented "the milking, or dual-purpose, strain of the breed as it is found in Wisconsin."

Divided in this way, group 1, cows weighing less than 900 lbs. and *nine* of the eleven, classified by Prof. Carlyle as being of the "extreme dairy type," returned an average annual net profit, according to the table on page 65, of $47.51; group 2, $37.67; and group 3, the 1,100-lb. cows, $41.89. Group 3, it should be repeated, contained 4 dairy-type Holsteins and the one phenomenal Red Poll, otherwise its average when confined to dual-purpose Shorthorns would have been much less.

Can anything be more certain than that these figures do not condemn the small dairy type cow? Is there anything in these figures to justify the dairy farmer in adhering exclusively to cows weighing 1,000 lbs. or more? It must not be assumed that this defense of the small cow is in any degree an attack upon the large cow. If it be urged that the cows in group 2, weighing from 900 to 1,100 lbs., were not as profitable producers as those in group 1, the sufficient answer is, that this was not on account of their size, but because they did not happen to be as good representatives of their respective breeds as the others. And as for those large Holsteins, it may be said that, without any fault on their part, they were found, like unfortunate dog Tray, in bad company.

On the whole, therefore, may it not be justly claimed that Bulletin 102, instead of furnishing any evidence to disprove the theories and teachings of HOARD'S DAIRYMAN or its Senior Editor, as has been hastily assumed in some quarters, does, in fact, confirm and support them? The logic of the facts set forth in that bulletin compels us to continue to advise the dairy farmer to give no heed to false prophets, but stick to the dairy-type cow regardless of size. If he has a decided preference for "cows weighing 1,000 lbs. or more," there is abundant opportunity for him to gratify that preference and still keep within the boundaries which define dairy type of pronounced character. If he is indifferent as to size, he has the widest possible field from which to select cows that would be a credit to any dairy herd. Finally, if he prefers the smaller type of dairy cow, there is no reason known to us, certainly no valid reason given in Bulletin 102, why, from the standpoint of profitable production, he should not fill his stable with cows answering that description.

INQUIRIES AND ANSWERS.

Every inquiry must be signed with the name, Post-office and state of writer. Condence the questions into plain epecific inquiry. Be careful to note if your questions eave not been answered in replies to others. We are glad to answer all the pertinent questions that we can concerning machinery. Look over our advertising columns and write to the advertisers.

A Stable Query.

1 am building a barn for my cows, 24x32x16. Expect to have feed way of 6 feet in center and stand cows on one or both sides. Will use drop siding and line inside with shiplap. Will that make stable too tight for cows? How can I ventilate this barn. It will be 7½ ft. between floors. I. H. D.
Conway, Iowa.

A stable only 24 feet wide is much too narrow for two rows of cows. After taking out 6 feet for a feeding alley and at least one foot for the sides there will remain only 17 feet for mangers, platform, gutters and walks. The mangers, platform and gutter for one row of cows will occupy at least 7½ feet, and 4 feet for a walk behind the cows is certainly none too much.

It is impossible to make a stable too warm or tight, but provision should be made for introducing fresh air, for which see page 773, and for removing foul and vitiated air. The latter is accomplished by constructing a flue at any convenient place, on the same principle that a chimney is built, with an opening at the bottom, which will correspond to the old-fashioned fire place. For 20 cows this flue should be not less than 2 feet square.

Stable Queries Answered.

Will you please give me plans at once for finish ing the basement part of a 100 ft. by 40 ft. barn so that I can keep 8 horses and the rest for Holstein cows. The bridge wall will be set back 10 ft. I want to build silo on south side. The barn stands north and south.
This is to be one of the best barns in this locality. I have the privilege of finishing the basement for my business, and that is cow business.
Copley, O. W. W. S.

Cut off 25 feet at one end for horses, with a tight partition, but have rolling doors to a doorway 10 feet wide in the center, communicating with the cow stable. This will leave nearly 75 feet for cows. You should provide three box stalls, one for the bull and two for cows, and there will be need for passage ways and stairway, and there will then remain, counting both sides, about 114 lineal feet for say, 24 cows. Make the central drive way 10 feet wide with a gutter on either side. Use some one of the improved stalls for the cows. We can not undertake to advise which one, because we have not tried them all, and if we had, our judgment would probably not coincide with that of others. Send to the advertisers for their circulars and terms and then use your own judgment. Large Holstein cows will require a platform not less than 5 feet wide and mangers about 2½ feet, and there will remain from 4 to 5 feet on either side for feeding alleys.

The floors, gutters and mangers may be of cement, but the platform on which the cows stand and lie should have a plank covering.

More important than all else is provision for ventilation, that is for the removal of foul air and admission of pure, fresh air, for which see page 773.

A Texas Ration.

Please formulate a balanced ration for my cows, weighing from 700 to 1000 lbs. I have the following feeds of my own raising: Cotton seed, $12.50 per ton; crushed corn with cobs, 50c per bushel; sorghum hay at 6 or 7 dollars per ton and plenty of green sorghum and kaffir corn as long as it lasts (until frost.) Bran I can buy at $18 per ton, brewers grains dry at $15 per ton.
San Antonio, Texas. J. F. S.

We frankly admit that there is too little to be gleaned from books about the feeding of cotton seed to milch cows to warrant the expression of very decided views one way or the other and of course we are without personal experience with such a feed stuff. From the analyses which the chemists make we should much prefer the dried grains at the prices named. If this inquirer's experience and observation tend to the use of more or less cotton seed we cannot object. If the cotton seed is omitted we suggest as a good average 6 lbs. of the dried grains, 2 to 4 lbs. corn and cob meal and the sorghum hay in such amounts as the cattle will eat without waste. Cotton seed might probably be substituted for the corn and cob meal, but if fed in larger amounts we should expect the resulting milk and butter to be more or less off in flavor.

Viscogen.

Please give me formula for "viscogen" or sucrate of lime. H. R. G.
Newport, Ohio.

Dissolve 2½ parts of granulated sugar in 5 parts of water; slack one part of quick lime in 3 parts of water. Strain the milk of lime through a fine sieve to remove coarse, unslaked particles and then add to the sugar solution. Shake the mixture at intervals for 3 hours and allow to settle. The clear solution is viscogen.

Some Dry Forage Required with Silage.—A Quebec Ration.

Will you kindly give me balanced ration from the following feeds for milch cows: Ensilage (corn), gluten feed, linseed meal, wheat bran. I would be much obliged if you could answer this by letter at once. J. M. LeM.
Compton, Que.

We do not think it advisable to limit cows or other stock to silage for roughage. They need at least some dry forage. Straw of any kind will answer, if nothing better can be had, but, of course, good clover hay would be better. If dry forage is very scarce, try to get each cow to eat 50 lbs. of silage, and, if they are able to yield more than 20 lbs. of milk daily, supplement this with 4 lbs. bran and 4 lbs. gluten feed daily. Not counting any dry forage, this will give a ration containing about 20 lbs. of dry matter, in which there will be 2 lbs. of digestible protein, 10½ lbs. digestible carbohydrates, and something over a half pound digestible fat.

It is so seldom, at any time, and more particularly at this season of the year, that the editors can find time to answer inquiries by personal letter, that we are reluctantly compelled to adhere to the rule which obtains in most offices. For example, the foregoing inquiry, although mailed Nov. 5th, was not reached in its regular order until Nov. 16th. Of course it takes but a few minutes to write a single letter, but if the rule should be relaxed there would be hundreds of such letters to write.

For Some Good Missouri Holsteins.

I have plenty of the following for feeding my Holstein cows in milk; may I ask that you advise me the proper amount to feed for best results? Dry brewers grain, wheat bran, ground corn, linseed meal, clover hay. Kafir corn fodder, corn fodder.
Would like to know if it is better to feed dry brewers grain, wet or dry.
We have made some good sales by advertising in your paper. T. G.
Arcadia, Mo.

The dried grains, preferably well soaked before feeding, reinforced with ground corn should be ample, especially with a little linseed meal on hand for use whenever needed to secure proper action of the bowels, and give a finishing touch to the hair and skin.

We suggest, say, 15 lbs. clover hay, 6 lbs. dried grains, and 2 to 4 lbs. ground corn and the corn or Kafir corn fodder in such amouut as will be eaten without unnecessary waste. The hay, grains and corn would tabulate as follows;

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
15 lbs. clover hay.....	12.70	1.02	5.37	.26
6 lbs. dried grains...	5.51	.94	2.18	.31
2 lbs. ground corn ..	1.78	.16	1.33	.09
Totals	19.99	2.12	8.88	.66

Each cow would probably eat about 10 lbs. of the fodder in addition, and this would suffice for all but the larger milkers, and there is no rule known to us by which to determine how much to feed them except to say feed as much as they will eat with good relish and make profitable returns for.

An Arkansas Ration.

Please give me a balanced ration from the following feeds: Alfalfa hay per ton, $11; wheat bran, $25; cotton seed meal, $28; cotton seed hulls, $9; cotton seed, $15; corn per bushel, 50c.
Mineral Springs, Ark. C. C. C.

We should feed no other roughage but alfalfa hay, and for concentrates would use bran and ground corn, in equal parts by measure. For cows that can respond with, say, 20 lbs. of milk per day, 6 to 8 lbs. of the mixed grain as above, with all the alfalfa hay they will eat without waste, would be ample.

Analysis of Cotton Seed Meal—Improving Stand of Alfalfa.

I enclose card attached to each sack of meal that I have bought, and am feeding to my cows. I do not fully understand it. Does the "protein 43%" include the ammonia 8.50% and the nitrogen 7%? How about the carbohydrates? Does the law require the amount of these to be given?

I have another question. I am "one of 99" who have failed to grow alfalfa, and am still trying, following the teaching of the DAIRYMAN. Can I succeed in bettering my stand on a plot, sowed last spring, by disking, or harrowing, and seeding next spring? The stand is not good, but looks too good to turn down. If so, when, in this latitude, ought it to be done?

These are my first questions. I have often thought to write, but, by waiting and watching, the answers have come. J. M. P.

Godfrey, Ill.

The card accompanying these inquiries gives the following as the guaranteed analysis of the contents of sack to which it was attached:

Ammonia, not less than 8.50 per cent; nitrogen, 7 per cent; protein, 43 per cent; crude fat and oil, 9 per cent.

In a way this is deceiving. Ammonia and protein are in effect different forms or compounds in which nitrogen is the predominant or most valuable principle. The 43 per cent of protein contains all the nitrogen, and ammonia is the nitrogen with one-fifth of its weight of hydrogen added. These different statements of the nitrogenous part of the cotton seed meal are given presumably to show its fertilizing, as well as its feeding value. Carbohydrates are so plentiful and cheap that it is usually unimportant whether purchased feeds contain little or much.

In regard to the question about improving the stand of alfalfa, it becomes us to speak with a good deal of reservation. It is claimed that the greater part of the soil of Illinois is too deficient in lime for satisfactory succees with alfalfa, and that it is also necessary to inoculate the soil there with the special alfalfa bacteria. We do not have the same difficulty in Wisconsin, and have yet to hear of any locality where the common red clover will grow that alfalfa will not also do well. The personal experience of the writer of this reply is limited to a singie trial. We had, last spring, a small field of alfalfa with several bare spots in it and in other places a very thin stand, but elsewhere and on the greater part of the field the showing of alfalfa was satisfactory. Contrary to the advice of some of our neighbors we reseeded the bare and thin places and in addition to securing a fair growth of hay, have now a field showing a nice and even stand. We did the reseeding as early in the spring as the ground was fit to work.

Butter and Cheese Yield.

Answer in your paper. A hauls milk testing 4% to a cheese factory. B hauls milk testing 4% to a creamery. Give me the approximate yield of A's milk per cwt. in cheese, also B's yield per cwt. in butter. E. W. H.

Elmo, Kans.

Four per cent milk should yield 4.66 lbs. of butter if one-sixth overrun is taken for the average. It is probable that the average overrun is somewhat below this in actual creamery practice and that 4.50 would be nearer what may be expected. There is the same uncertainty in calculating the cheese yield, owing to difference in makers and quality of milk, but the average yield of cheese from 4.0 per cent milk is 2.50 pounds for each pound of fat, or 10.00 pounds of cheese to 100 lbs. of milk.

What to Feed with Green(?) Alfalfa Hay.

I live where we feed green alfalfa hay nearly the year round. There are no silos here at all. I feed alfalfa hay and feed three times a day all they can eat. I did feed 6 pounds of heavy wheat bran to each cow for 6 months, but got no better returns than from alfalfa alone, without the bran. Now if you can tell me what to feed with the alfalfa to make a balanced ration, I will be very much pleased. Bran is $1.20 per hundred; ground barley is $1.15 per hundred; the corn meal $1.75 per hundred; oil meal $2.50 per hundred; wheat and barley hay $10 per ton. No more this time.

Riverside Co., Calif. H. B. A.

We know that a good many California dairymen advocate feeding nothing but alfalfa, but reasoning somewhat from analogy, we have been unable to convince ourselves that it would not be profitable to add some concentrated feed. Alfalfa carries 11 per cent of digestible protein, but is deficient in carbohydrates. Corn and barley are low in protein, but rich in carbohydrates, and we therefore advise this inquirer to try a few pounds of ground barley with some of his cows and note the result.

A Mixed Feeding Problem.

Please give me a grain ration for Jersey cows, that freshened in Sept.

I have several that will freshen in January. Will the same ration apply to them when they drop their calves?

Have for roughage, mixed hay, and silage that was sown thick in drills and just commenced to ear when it was put in silo.

Corn meal, $1.20; bran, $1.20; cotton seed meal, $1.40; gluten, when we can get it, about $1.60 to $1.75. W. W. TUTTLE.

York Co. Maine.

Silage from immature corn is not a very "hearty" feed and sometimes must not be fed too liberally, as it may cause excessive looseness of the bowels. We suggest trying 30 lbs. of the silage, 15 lbs. of hay, 4 lbs. corn and 2 lbs. cotton seed meal as a maximum daily allowance. The cows that are to freshen in January, should be fed very sparingly of grain for a few days, and after that worked up to the maximum gradually, taking from 20 to 30 days to get the cow on full feed. Indeed no changes in feed should be brought about suddenly, except in cases of emergency, when necessary to arrest indigestion or other abnormal conditions.

Cost of Acid for Babcock Test.

What is the value of the acid used in making one test with the Babcock tester, using 17.5 c. c. acid measure?

What kind of a preservative should be used to keep milk samples, from a number of milkings, to be tested? W. A. R.

North Jackson, O.

The acid for a single test costs somewhat less than a quarter of a cent, depending on the price paid for the acid.

For preserving the milk samples, powdered bichromate of potash is used. For a pint of milk take as much of the preservative as will fill an empty .22 cartridge shell. An excess should not be used as it will cause trouble in testing.

Vermont Dairymen's Meeting.

ED. HOARD'S DAIRYMAN:—Owing to a mix up of dates the Annual Meeting of the Vermont Dairymen's Association has been changed from St. Albans to Burlington City Hall, January 5, 6 and 7, 1904, headquarters at the Van Ness House.

Van Ness House and Burlington Hotel, as fine hotels as any in the state, offer reduced rates where two occupy the same room.

Among the speakers already engaged are Ex-Gov. Hoard, H. C. Adams, Member of Congress from Madison, Wis.—both of National reputation as lecturers on dairy work; Prof. J. L. Hills, Burlington; Van Dresser, New York; E. Sudendorf, Secretary of National Creamery and Butter Makers Association, St. Louis; and M. A. Adams, M. H. Clarke and others of state reputation.

Tuesday eve will be given to the Ladies' Auxiliary, who have a fine program under way.

A banquet will be served Wednesday evening at the Van Ness House. D. J. Foster of Burlington, Member of Congress, is expected to act as toastmaster—a position he can most ably fill.

Large premiums and specials will be offered. It is hoped that every creamery in the state will make a special effort to exhibit a sample of butter, also their butter maker attend the meeting, as well as every dairyman, and join in the discussions and have a short experience meeting after each address.

N. Promfret, Vt. F. L. DAVIS, Sec.

Potato Blight.

ED. HOARD'S DAIRYMAN:—Will have to beg off for neglecting your paper as I have been drifting off from farming during the summer, but have gone back to dairying. I am milking twenty-eight cows at present: will have a few more soon. We have a ready market for our cream. We all have De Laval cream separators. We are located on the Columbia river bottom which is well adapted for cows.

We are bothered here with blight on the potatoes. It strikes them just about the time the small potatoes begin to set; tops turns black in spots and keep getting worse each day until the vines are all dead; the potatoes stop growing at once when the blight strikes them.

Fishers Ldg. Wash. W. A. H.

It is uncertain whether the trouble came from the true blight or the potato flea-beetle. In either case the only remedy is spraying with Bordeaux mixture.

Dairy Straws from Ohio.

ED. HOARD'S DAIRYMAN:—There may have been seasons when it was as difficult to handle cows to a satisfactory profit, but our memory fails to point to that year. With the exception of two weeks during the latter half of July, this township has had absolute drouth since the first day of April. A freeze two days and nights about the middle of April killed the clover and seared the blue grass pastures which had started with wonderful vigor during the warm rains and days of the last of March.

From illy prepared seed bed, corn made

"ADVERTISEMENT."

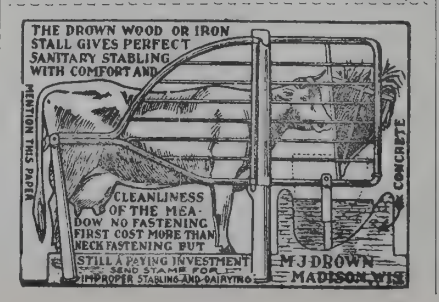
THERE IS GREAT DANGER IN CATARRH.

If Left to Run Its Course Unchecked, It Often Causes Death.

Catarrh scatters its poisons throughout the entire system. The stomach and lungs are affected by the droppings that fall into the throat and are swallowed during sleep. Dyspepsia, inflammation of the stomach, bronchitis and consumption are the results. The blood also becomes contaminated and carries the poisons to all parts of the system. Frequently in the more advanced stages, the bones of the head become decayed and the air passages are a putrid mass and create a stench so foul and offensive as to be unbearable. The expression "rotten with catarrh," is not overdrawn or exaggerated.

Stuart's Catarrh Tablets strike at the root of this terrible odious disease and eradicate it from the system. They are a constitutional remedy that cleanses the system thoroughly of all poisons and purifies the blood. Under their influence the head becomes clear, the discharges at the nose and droppings into the throat cease, the lost sense of smell is restored, the eye brightens, the foul breath becomes pure and sweet and the odious, disgusting disease is thoroughly expelled from the system.

A Cincinnati man says; I suffered the mysery and humiliation of catarrh for 12 years. My case became so aggravated that it seriously interfered with all my business relations. The disease became so offensive that I would not venture into any one's presence unless it were absolutely necessary. I tried every remedy that I could get hold of. Some helped me temporarily, but as soon as I ceased taking them, I would relapse into the old condition.



"Finally a friend told me of Stuart's Catarrh Tablets and insisted that I try them. I had about dispaired of ever finding help, but bought a box anyway. I began to notice the improvement within twenty-four hours after I began taking them. Before the first box was gone I felt like another man. I kept up the treatment till I had taken three boxes and was entirely cured. I have never had a recurrence of the trouble from that day to this. My head is clear and well and none of the offensive symptoms of the disease ever trouble me. It has been two years since I stopped taking them."

Stuart's Catarrh Tablets are for sale by all druggists at 50 cents a box.

Pioneer Brand
Parchment Paper
is the buttermakers, sure protection. A pure vegetable parchment with no smell to impart, shuts out foreign odors and preserves delicate flavors.
Sheets for Print Wrapping, Box Linings, Circles and Tub Linings. Name or brand on sheets when ordered. Write for samples. Book, "Better Butter," free.

CHAIN-HANGING
CATTLE STANCHION
The Most Practical
CATTLE FASTENER
ever invented.
Manufactured and For sale by
O. H. ROBERTSON,
Forestville, Conn.

Foster Steel Stanchion
made entirely of steel and malleable iron. **Unlike all others.** Affords greatest freedom and motion and always holds the animal. Hung on chains—moves all ways. **Lightest, strongest, most convenient** and easiest to open and close.
GOOD SELLER—BIG PROFITS.
One agent sold 75 first day, Another sold 200 first week. **We want responsible agent in every Dairy Community.** Send for circular number 30
FRANK H. BATTLES, Seed Grower,
Rochester, New York.

This Taylor Stanchion

is made of angle steel lined with hard wood on side next the animal's neck. **It is lighter, neater and stronger** than any other stanchion made. Swings on casting at top and bottom and admits of greatest freedom of motion. Cattle can lay with head on side. Easiest opened and closed. **Reliable Agents Wanted.** Write for special terms, prices, etc.
JAMES BOYLE, SALEM, O.

WARRINER'S CHAIN HANGING STANCHION.
CLEAN, SAFE, COMFORTABLE.
MFG. BY W. B. CRUMB, Forestville, Conn.

a slow and feeble start in a dry and parched soil and stood dormant in a cold temperature for weeks. Pastures never revived from the set back in April. The ensilage planted June 2nd, made wonderful growth with so little rainfall. Its development was simply marvelous, making three-fourths of a crop with but one rainy spell in last of July. Then for two months it grew without rain.

Dropping back to the cows, we began to increase our grain ration by the middle of August until our soiling corn began to be ready for use. That helped to hold us out very materially, but short crop and excessive drouth began to shorten time and supply on that, and by Sept. 25, there was but little green forage left to draw on. This demanded more grain and some hay, and the demand has increased each week with no rain and decrease in pastures until we are on almost a wint r ration.

With bran at $20, oil meal $24, hay $18, oats 50 cents, corn 75 cents and stover not on the market, means that cow keepers are "scratchin" their heads in an effort to make "buckle and tongue meet." We havn't had such a year since God made little apples and don't want another for a blooming long time. The reason we haven't written for the DAIRYMAN the past summer was because there were no "dairy straws," and water was too scarce to thin the ink when it dried up.

While John Gould wades around in gum-boots, growling about mud and water, we smother in dust and wear our last year's shoes to cut down feed bills, and turn our faces each sunset and look for a cloud.

From our hills, looking away over hill, valley and forest, the eye sees many spots to which distance "lends enchantment," but our Jerseys look at the barn and long for milking time through the long afternoon hours. They, the hills and the variegated forests in the background, make a beautiful picture but for the brown, sunburnt pastures that lie between.

This is simply a passage of time against expense, wearing out the November days until we open the silo and start the cows on winter pasture, shredded corn stover and a semi-daily ration of ground grains.

It will be a relief to get the cows into winter quarters and cut out the despair of autumn days, resplendent in everything but profit from feed bills.

It is said that misery loves company. In a sense it does, but how quick a fellow will get out of its company when opportunity affords. In a measure we are all enjoying the pleasure of it, but the farmer who has been putting humus into his soil for years, found out that his good fortune lay in it as the source of profit this year. The measure of value in such land will be 35 to 40 bushels of shelled corn instead of 5 or 10 bushels of very inferior corn from fields under constant cultivation with nothing returned.

Last spring we measured up one-half acre and put it in good condition for corn. The seed was a special hybrid of our own, highly selected, and after shelling, all imperfect grain discarded. The soil was manured and corn planted with 200 lbs. of a perfect formula of fertilizer used. It was drilled, grains 13 inches apart, and rows, 3 ft. 6 in. The stand was perfect. It was cultivated four times and hoed once. These cultivations were given at opportune times, when they would do most good in the destruction of weeds and conserve the moisture. I never grew a crop under more adverse conditions, but was determined not to give it more expense than our other corn crop, and did not. Results are a good three-fourths crop of early, well matured corn, the best of which will go next year for our field crop.

I have kept an expense account with the crop and when husked will know just what it will have cost me to grow it. It is quite an easy matter to grow a good crop in a good year, but say, neighbor, it takes a lot of hedging to get anywhere near one when it neither rains nor hails.

I remember reading that it requires 300 pounds of water to mature a single pound of dry matter in a corn plant. Where that ensilage corn got its moisture is a mystery, with only one good soil-soaking rain when knee high, and nothing for near two months to even give it a drink, yet make a good three-fourths crop.

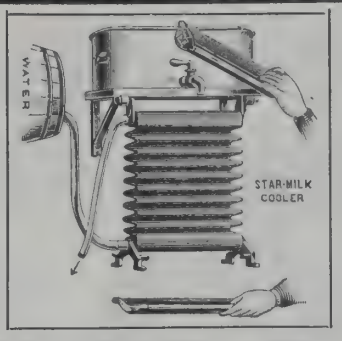
A little about our round, wooden-hoop silo that John Gould advertised in a recent article. I have seen and examined a hundred silos of every size, pattern and method of construction, and am fully persuaded that the one just completed and filled at Maple Valley farm is the silo for the future.

It is simple, cheap, strong and durable, and will keep silage as perfectly as one costing double the money. It is 13 feet in diameter, 32 feet high; has 13 hoops, 2×3 inch, made from 3 ply of ⅝×3 inch strips well nailed together with broken joints. Each hoop set above the other on short studs and built in two sections, with 3½ inch yellow pine flooring. Two carpenters put it up in five days, and we filled it on the sixth day. The cost will be about $75 with a board roof on it. We may weather board it later on, but that will not add much to its life or keeping qualities, but materially to its cost. I believe this is a model silo for the dairyman who has little money to put into one and feels the need of it in his work.

I have found that it is the expense attached to a dairy herd that makes it a failure or success, and that it becomes necessary to cut down that outside outlay at every point, and believe the same thing is incumbent upon others who are in the work for the profit they can get out of it.

For two years past we have been producing cream for ice-cream purposes. The work connected with it is not so laborious as that of making butter, but it is exacting. It requires constant watchfulness and exactness that demands the attention of one person all the time, whose business it should be to see that the density remains at a standard, that the cream is aerated or properly cooled directly from the separator. The separator must be run at a regular required speed each time to insure uniformity of fat content. Cans must be scrupulously clean and the seams gone over to eliminate foulness that sows the worst kind of bacteria broadcast into what would otherwise be fresh, sweet cream.

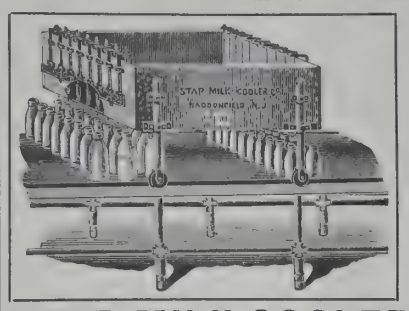
A chain is no stronger than the weakest link in it, and the same thing works in the handling of milk and cream. One's success depends altogether upon the application of stringent sanitary rules from start to finish. Neglect at any point from milking hour to the hour of shipment puts in a weak link that will destroy hours of honest and careful work. The greatest difficulty along the whole line is the returning cans which are either delayed by the purchaser or belated on the road unwashed, and come back so foul that they are unfit to go near decent quarters.



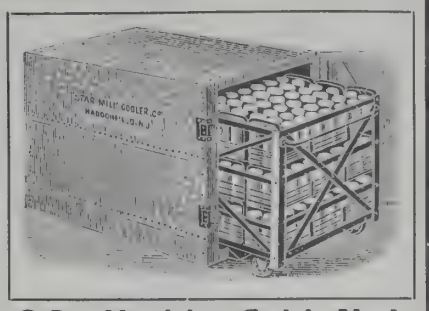
The sanitary ordinances of every city should require that every purchaser of milk or cream should cleanse the cans as soon as emptied and go back to the shipper with at least a fair degree of healthful cleanliness.

Large establishments do this and thereby insure a better and sweeter article when shipped into them daily.

It is an aggravation to the careful dairyman to have the weak link in his chain to come from a quarter that he cannot control or overcome without extra scouring, steaming and scalding.



Ohio. GEO. E. SCOTT.



Who Does Without Us Come to Grief We Are a Power in the Dairy World

We can cool your milk, fill your milk bottles and sterilize your milk utensils in a very short space of time.

BUHL CANS ARE NOT Like Other Milk Cans Because They Are Better

This is equally true of the Buhl Factory, "Improved Elgin" and Genuine Iowa Cans; superior material, design, workmanship and smooth finish combine to produce those long wear qualities for which the Buhl Cans are so renowned. Remember the Buhl is the only can in the world that is made with the BUHL "VICTOR" CAN BREAST and the BUHL "VICTOR" ROUND HANDLE They may cost a little more than common cans—we do not know, for we cannot tell how badly "the trust" and others are beating you. We know that the small added cost of the Buhl Cans will prove the best can investment you ever made. Every can that is stamped with our famous Milk Can Trade Mark, as shown here is a genuine Buhl Can. The mark is a guarantee of all around excellence. Ask your local dealer for Buhl Cans. If he does not have them he can get them for you. Write us about it. We will see that you are supplied.

Buhl Stamping Company, 212 W. Larned Street, Detroit, Mich.

The Distribution of Skim Milk.

It is known that the just complaints of creamery patrons on account of unfair distribution of skim milk are the bane of the separator creamery business. Further disputes among patrons, annoyances to managers, hindrances to the best work of buttermakers, watering the skim milk, and many other ills in the same train are unnecessary, since the

Barber-Coleman Check Pump

has for more than five years been successfully solving the problem in many different creameries. When a patron has dropped in his check he can pump the amount of skim milk called for by his check, less the percentage taken out as cream, so in like proportion to all other checks. Its measuring apparatus is just an ordinary pump which everyone understands and knows how to operate.

Modern Merchandising

Have you ever stopped to think about the question of getting your household supplies to the best advantage? Are you perfectly satisfied with the way things are running—with the prices you pay, the quality of the goods, the range of selection and the general question of making both ends meet? Perhaps you buy your supplies from the cross-roads store, just because your grandfather did. Perhaps you are tied up to the general store because you can trade in your butter and eggs at a low price and take it out in trade at a high price. Possibly you have never thought about it one way or the other. It is time to think. You have got to live and support your family. Your income is limited to so many dollars per year, and you have got to figure out the expense account so that things will come out right at the end of the year. If you can make both ends meet nicely and lay aside a tidy sum for a rainy day, you are only doing what every head of a family should endeavor to do, and if you don't do it you are simply inviting misery for the next time the crop fails. If a dollar looks as big to you as we think it does, we want you to think over this question of modern merchandising and see just what it means. It means different things to different people. To some it means buying everything on credit, then mortgaging the farm when settlement day comes around. Others think cheap goods the pathway to economy—the cheap, worthless trash that is advertised so brazenly at "the lowest price on earth." Many people send off to the city and get a jack knife at a 25 cents saving, and then fall back into the old rut in buying the balance of their supplies. Our idea of modern merchandising is to supply all your wants—everything you eat, wear or use—for yourself, your family and the hired man, at an average saving of 15 to 40 per cent, which means that if your yearly purchases amount to $200, you can save something like $50; or $100 if it costs you $400 a year to live. Are you so well off that $100, or even $50 does not interest you? Then again, consider the advantages. Absolutely reliable merchandise of the very best quality, and an unlimited range of selection. New goods. Prompt service. Prices that spell economy, and the certain knowledge that absolute satisfaction is the keynote to every transaction. To make trading with us possible, we issue a catalogue of 1128 pages, in which almost everything imaginable, including Vehicles and Farm Implements, is illustrated, described and priced. This catalogue can be absolutely depended upon and enables you to select your entire bill of merchandise without hurry or confusion and with the certainty that everything will be found exactly as described or you need not keep it. We ask you to get out of your present rut and give our methods a trial. We satisfy others and will satisfy you. There never was a better time than right now to begin, for we have just issued a new catalogue full of the things you will need to see you through this winter, and you can make no better investment than to fill out this coupon and send it to us now while the subject is in your mind. We ask 15 cents, merely as an evidence of good faith on your part. If you will risk 15 cents, we will risk sending you a catalogue that costs us over half a dollar to print and is so big that it requires 26 cents postage. It is our 76 cents against your 15 cents. Will you do it? Write today.

Laying in Supplies: Living from hand to mouth is one way of living, but why not get your supplies on a wholesale basis and avoid the petty annoyances of retail buying, to say nothing of making four dollars go as far as five dollars used to. That's the grocery list you see hanging on the wall. Supplied with loops to hang up with. A postal will bring it. Nothing like groceries for a foundation for a 100-lb. freight shipment.

Montgomery Ward & Co.

Dairy Figures of Portage County, Wis.

County Clerk Lane reports for 1902, as follows: There are twenty-three creameries in the county, valued at $44,125. Number of patrons during the past year, 1,365. Number of cows contributory, 7,666. Number of pounds of milk received, 22,964,949. Number of pounds of butter made, 1,117,925. Amount received for products sold, $248,264.71.

Of cheese factories there are three in the county, valued at $2,300. Number of patrons, 88. Number of cows contributory, 540. Number of pounds of milk received, 405,860. Number of pounds of cheese made, 37,633. Amount received for product sold, $12,700.

In addition to this the number of pounds of butter made on the farms is given as 104,111, the value of the same being $16,361. Number of gallons of milk sold, other than to creameries and cheese factories, 155,738.

According to these figures, the total cash products of the county for the year was $294,066.

According to the above, the yield of butter per cow is 145 lbs. per year. As it takes 200 lbs. of butter to pay for the care and feed of a cow, it is evident that there is room for improvement in the Portage county cows.

A Pennsylvania Feed Inquiry.

I would like you to figure me a balanced ration out of the following feeds:

Corn stover, well eared ensilage, Timothy hay, $18.00 per ton; corn, 50 cents per bushel; wheat, 80 cents per bushel; oats, 45 cents per bushel, linseed meal, old process, $30.00 per ton; wheat bran, $20.00 per ton; middlings, $21.00 per ton; cotton seed meal and hulls 3% fat 10% protein, $15.50.

I have 16 cows in all stages of milk, 6 horses, 2 mules, 10 calves from 6 months to 1 year old, one registered Jersey bull, 15 head of swine. I make butter. I wish you would answer the above thoroughly through your paper, which I think is the best of all dairy papers, and I am very much surprised that our dairy men in this section do not read any dairy paper, as our farmers seem to be intelligent, but they think that the money and time that they spend on a dairy paper is lost. It seems that there is no way that they can be brought to see the false economy of their way. I, for my part have all to learn, but I certainly want to get all the information possible. We can never get enough, if we wish to stand at the head of any profession.

New Holland, Pa. E. M. M.

At the price named, the most profitable disposition that can be made of the timothy hay is to sell it. Give the cows 40 to 50 lbs per day of that well eared silage and have 30 to 40 tons left for young stock, horses, mules and pigs, but feed little or none to the bull. In addition let all the stock have all the corn stover they will eat without unnecessary waste. Having silage, the presumption is there is a cutter on the premises. If so, run the stover through this cutter, enough at a time to last a week or ten days or longer. Dampen a little and let lie in a pile, where it will heat and soften. This will not only prevent much of the waste but leave what is not eaten in good shape for bedding and the manure. Grind some of the corn, cob and grain together if it can be made fine, and mix with oil meal in the proportion of 4 lbs. of the former to one of the latter and feed as much of this to each cow as she will pay for. Feed the bull corn stover, bran and oats so as to keep him in good condition.

Bran or Cotton Seed Meal—Cow Peas.

Which will be the cheaper to feed with good ensilage, bran at $20 or cotton seed meal at $28 per ton? I do not want to feed heavy, say a pint of cotton seed on the ensilage morning and night, and good timothy, clover and mixed grasses for hay at noon.

Is cotton seed meal injurious to cows if fed for a long time?

I do not want to dictate what you should print in your paper but think you ought to reprint, with such changes as you think best, page 772 about feeds. It is worth more to the thinking dairyman than your paper costs per year. It ought to be in the DAIRYMAN every 4 or 6 months.

At what time should cow peas be planted with corn to make good silage (when the corn is planted.) Will cow peas grow here where the season is short? C. C. M. (M. D.)

Bar Harbor, Me.

We should prefer not to confine cows in milk to either bran or cotton seed meal alone, in connection with silage and mixed hay for roughage, but would mix them, and as a rule, limit the cotton seed meal to not more than 2 lbs. per day.

Although cotton seed meal almost invariably proves fatal to calves and pigs, there is no record, so far as our reading has gone, to show that it would be injurious to grown cows, if fed, not to exceed two pounds daily, for an indefinite time.

We do not think cow peas could be depended upon to make a profitable crop anywhere in Maine, until a variety or sub-variety could be developed, by selection of seed, adapted to that climate.

Our Special Elgin Letter.

ED. HOARD'S DAIRYMAN:—The Quotation Committee of the Elgin Board of Trade reported the official market firm at 22 cents.

Dundee offered 50 tubs but no sale was effected.

The former markets were:

Nov. 9, 1903, 22 cents.
Nov. 17, 1902, 26½ cents.
Nov. 18, 1901, 24½ cents.
Nov. 19, 1900, 26 cents.
Nov. 20, 1899, 25½ cents.

Nov. 16, 1903. H. C. B.

DAIRY MARKETS.

ELGIN, Ill., Nov. 16—Butter ruled firm on the Board of Trade to-day, selling at 22c. a pound. Sales in the district for the week were 635,000 pounds.

South Dakota

is the place to go if you have made up your mind to stop paying rent and start on the highway to independence. Farm lands can now be bought at prices that will allow a good profit on the sale of products. Recent extensions of the

CANTON, N. Y., Nov. 14—Cheese—Offered 1,410 boxes of Twin cheese, and 951 tubs of butter. Cheese sold at 10c; butter at 21c.

LIVERPOOL, Nov. 16—Butter—Good United States nominal. Cheese American finest white, dull, 52s; do colored, quiet, 54s.

NEW YORK MARKET.

NEW YORK, Nov. 14—Butter—Receipts for the week, 31,960 packages. Exports for the week, 1,200 packages.

The demand continues good for the extreme top quality of fresh Creamery, but for all other grades the market is extremely dull and prices are easier and only nominal.

Fresh Western Creamery butter is coming poor and shows lack of feed and new milk, and many of the best Minnesota Creameries were turned down this week by retailers, as not good enough.

Fresh New York State goods are wintry and ordinary and are not in favor with buyers. Dairy make about done for the season. There is no wholesale business doing in Freezer Creamery butter, and while finest is quoted at 21½@22c, it would be impossible to sell any considerable line at over 20c. Ladle and packing stock is salable at 13@16c. We quote:

Creamery, fresh make, extra, 22½@22¾c; medium, 19@22c; poor, 15@18c; creamery, freezer, extra, 21½@22c; medium, 18@20c; poor, 13@17c. New York State Dairy, extra, 20@21c; medium, 16@19c; poor, 13@15c.

Cheese—Receipts for the week, 30,228 boxes.

Market ruled dull all the week, and although the prices for September makes were marked up a quarter, prices for all other grades were unchanged and favored buyers at the close.

Exporters bought mostly of low price skimmed cheese for which they paid 3@5c. We quote:

Full cream, extra, 11¾c; medium, 10¾@11½c; poor, 8@10c.

Eggs—Receipts for the week, 34,735 cases.

New laid eggs are very scarce and wanted at full prices. Other grades are in good demand at firm prices. We quote:

New York & Pennsylvania, new laid, per doz., 33@35c; Northern & Western, new laid, 20@32c; all sections, poor to good, 20@28c; refrigerator, poor to fancy, 17@23c.

177 Chambers St. DAVID W. LEWIS & CO.

BALTIMORE MARKET.

BALTIMORE, Nov. 12.—Butter—Although the weather conditions, so far this season, have been quite faverable for an increase in the make, there has been none; but on the contrary a further shrinkage of all desirable table grades is very much in evidence, particularly extras; the supply of which has been insufficient to satisfy the demand, and in many instances firsts have to be substituted. Imitation creamery continues in light supply. Ladles of desirable quality are in moderate receipt and good request. Rolls—The receipts are gradually on the increase; all good to choice lots, arriving in good condition, meet ready sale. Packing stock is in moderate supply and demand. Prints and blocks, though in moderate receipt the supply is about equal to the requirements. The market in general closes steady to firm on all desirable offeringe.

Creamery separator, extras, 23@23½c; firsts, 21½@22½c; seconds, 19@21c; imitatation creamery, extras, 19@20c; firsts, 17@18c; seconds, 15@16c; creamery blocks (2 lbs.), extras, 24c; firsts, 22½@23½c; seconds, 20@22c; do prints, (½ lbs.), extra, 25c; first, 23½@24½c; seconds, 20@22c; Md. Va. & Penna. prints, extras, 24c; firsts, 22@23c; seconds, 18@20c.

Eggs.—With the receipts of strictly fresh stock rather light and a good demand at 28 cents, our market rules firm on this kind, while held and mixed stock is moving slowly at irregular prices. Storage stock, when fancy, finds ready sale.

301 Exchange Place. G. M. LAMB & BROS.

SAN FRANCISCO MARKET.

SAN FRANCISCO, Nov. 12—A firm tone prevailed in the market for really fancy Creamery Butter yesterday and conditions generally were in sellers' favor. Supplies were fairly liberal, but as trade was fully up to the offerings of this grade, holders had no difficulty in maintaining the hardened prices. Stocks of the special brands were well absorbed at full figures, the more favored brands easily bringing the maximum quotation. Trading in the cheaper quality butter continued of a sluggish character, with values irregular and favoring buyers. Storage goods continued firm at previous prices. The percentage of really fancy Ranch Eggs in yesterday's arrivals was very small, and under a steady demand, the market was steadier, with values showing a slight improvement. Selected Whites were quickly marketed up to the top quotations and sales of the cheaper stock were liberal at the lower range of prices. In storage grades business continued of liberal proportions at maintained rates. Cheese values were without change and full quotations were easily obtained for mild, new, offerings.

Receipts yesterday aggregated 44,100 pounds butter, 657 cases eggs and 4,700 pounds of cheese.

Butter—Creamery, extras, 32@33c; good to fancy, 26@30c; dairy, extras, 24@25c; dairy, choice 22@23c; store, 18@20c; California storage, 24@27c, eastern creamery, 23@25c.

Eggs—Ranch, selected large, 44@45c; good to choice, 40@43c; store, nominal; California storage, 28@33c; eastern, 25@30.

Cheese—California creamery, mild new, extra, 14@15c; mild, new, choice, 13½@14c; Young America, 14@15½c; eastern, New York, Cream, Cheddars and Flats, new, 14½@16c.

Answers to Dairy Questions by Prof. Farrington.

Cost of Making Butter.

Would you please give me the approximate cost of making and handling butter from the delivery of cream from farm separators to time of shipment. I realize that this is a conundrum, the solution of which may be different according to location and circumstances. But as I do not know if it should be three cents or ten cents per pound, you could set me somewhere in the neighborhood. SUBSCRIBER.
Yankton, S. D.

I believe there are several firms buying cream from farmers at the present time that agree to pay the market price for butter fat in the cream when it is delivered to the railroad station nearest to the farmer producing the cream. The firm buying the cream pays the freight or express, whichever it may be, on the cream and returns the empty cans. Such an agreement as this amounts to about three cents per pound for making and handling the butter, provided the buyer makes the the cream into butter. Some ten years ago, the price for making butter from milk at creameries was four cents per pound. This price was nearly universal at that time. When a factory makes between two and three hundred pounds of butter per day, such a price per pound will give the factory a living margin with which to keep it up-to-date and warrant the employment of a competent buttermaker. Competition has reduced this price somewhat in recent years, however, and some factories now claim to make butter for their patrons at two cents per pound. The usual price, however, at the present time, is about three cents per pound.

The rate that should be charged for making butter will depend almost entirely on the amount of milk or cream which is manufactured. It will cost nearly as much to operate a factory which makes 100 pounds of butter per day, as to run one that makes three and four hundred pounds per day. Nearly the same amount of fuel will be used in one case as in the other, the wages of the operator will be the same, and the only difference between the two will be in the amount of supplies, such as salt, butter color and butter packages, used for making the larger amount of butter as compared with the smaller.

I do not think that farmers will produce milk or cream and sell it to a factory which charges ten cents a pound for making. The average price in this state at the present time is about three cents per pound, but if a smaller amount of butter is made, more than this must be charged in order to make the business a success.

Building a Skimming Station.

"The New Century Creamery Company wants to build a skimming station about seven miles from our creamery, and I am at a loss to know how to build an up-to-date plant.

We also want to know which will be the cheaper and more satisfactory, steam or gasoline power. We will have to haul coal and supplies seven miles to and from our railway station. We can raise stock at $1.00 per share, and think it would be necessary for us to have about $2,000 for this purpose.

Will you kindly give us some advice in regard to this new enterprise and inform us how best to arrange our machinery? F. B.
Green Bay, Wis.

In a great many cases skimming stations are placed in some building already erected where there is room for the machinery. Occasionally a building is erected especially for the skimming station, but this is not very common at the present time, as the general impression prevails that skimming stations are of doubtful economy.

All that you need is a room in which you can place the necessary machinery for handling the milk and skimming the cream from it. A skimming station outfit usually includes a milk-weighing scale with a weigh can which will hold about 500 pounds. This is placed near an open window through which the milk cans are received and emptied into the weighing can. A platform is built outside the window for transferring the cans from the wagon to the receiving can in the building. The receiving room need not be very large, but sufficient space ought to be provided so that a man may have plenty of room to empty the cans, weigh the milk and take samples of each lot of milk.

Shelves are usually arranged on the walls of the room around the weigh can, and on these shelves are placed the sample jars in which a sample of the milk of each patron is collected.

From the weigh-can, the milk runs into a vat, which ought to hold about 2,000 pounds of milk. It then flows from this through a heater to a separator, and the skim milk is pumped from the separator into a tank at some distance from the milk receiving window. The patrons draw their skim milk from this tank into their milk cans as is customary at a creamery.

The cream from the separator is usually run into small ten-gallon cans, which are placed in cold water and cooled to as low a temperature as possible, before being drawn the same day to the factory where the cream is ripened and churned.

A gasoline engine is sometimes used to supply the power for running the separator, milk pumps, etc. I have known of several places where such power has proved to be very satisfactory for this purpose. When a gasoline engine is used, the operator can start up his separator within half an hour at least after he arrives at the station in the morning; it is not necessary for him to get up steam in order to start the power for running the separator. A small boiler ought to be provided for heating the milk in the winter time, as it is necessary to warm the milk to near 80° F. in order to get an efficient skimming by the separator.

I should think, under the circumstances, that where you have to haul coal seven miles, the gasoline engine would probably be more economical for you than a steam engine, as you are transporting a great deal more energy in a given weight of gasoline than of coal.

If you have a building in which you can place the separator, milk receiving vat, gasoline engine and other supplies, I do not think that the necessary machinery ought to cost you over $1,500, in addition to the building.

I presume you will hire some man to operate this skimming station, and if you get one who has had some experience in creamery butter making he will be perfectly capable of setting up your machinery and starting the skimming station in a satisfactory way.

Questions in Milk Testing.

"I take the liberty to ask a few questions about the use of the Babcock test and about cheese making.

1st. Is there any danger of burning butter fat by mixing a sample of milk and acid too quickly so that it gets very hot?

2nd. How many revolutions per minute should a hand tester be turned when the bottom of the bottles make a circle 18½ inches in diameter?

3rd. How many minutes should it be turned before water is added?

4th. What is the range of temperature at which rennet may be added to milk?

5th. What is the highest temperature which the curd may be cooked without injuing it?"
Algoma, Wis. J. F. C.

Replying to these questions in the order in which they are asked, I have to say:

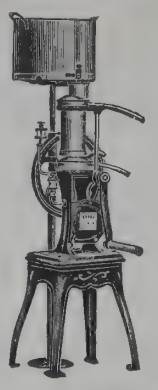
1st. If the sulphuric acid used in test-

"ADVERTISEMENT."

AN OLD TIMER

Has Had Experiences.

A woman who has used Postum Food Coffee since it came upon the market 8 years ago knows from experience the necessity of using Postum in place of coffee if one values health and a steady brain.



She says: "At the time Postum was first put on the market I was suffering from nervous dyspepsia and my physician had repeatedly told me not to use tea or coffee. Finally I decided to take his advice and try Postum and got a sample and had it carefully prepared, finding it delicious to the taste. So I continued its use and very soon its beneficial effects convinced me of its value for I got well of my nervousness and dyspepsia.

"My husband had been drinking coffee all his life until it had affected his nerves terribly. I persuaded him to shift to Postum and it was easy to get him to make the change for the Postum is so delicious. It certainly worked wonders for him.

"We soon learned that Postum does not exhilarate or depress and does not stimulate but steadily and honestly strengthens the nerves and the stomach. To make a long story short our entire family have now used Postum for eight years with completely satisfying results as shown in our fine condition of health and we have noticed a rather unexpected improvement in brain and nerve power." Name given by Postum Co., Battle Creek, Mich.

Increased brain and nerve power always follow the use of Postum in place of coffee, sometimes in a very marked manner.

Look in each package for a copy of the famous little book, "The Road to Wellville."

THE
Iowa Dairy Separator.

AN UP-TO-DATE MACHINE
REPLETE WITH PRACTICAL IDEAS

It is built in the following sizes:

250, 350, 450, 600, 750 POUNDS PER HOUR

Our 750 pound per hour machine is a practical Hand Separator. It is as easily run as most separators of 450 pounds and 500 pounds capacity.

MILK DEALERS COMBINATION Milk Protector, for cans or bottles. Prevents milk churning and souring in summer and freezing in winter. INVESTIGATE. S. C. Sullivan Mfg. Co., Erie, Pa.

ing has the right specific gravity (1.82) there will be no danger of its burning the milk so as to injure the test in any way. The acid ought to be poured into the test bottle in such a way that it will follow the sides of the bottle and form a layer separate from the milk on the bottom. As soon as the acid is all added in this way the bottle should be thoroughly shaken. This mixture will get very warm but this will do no harm if the shaking is continued until the acid and the milk are thoroughly mixed. If for any reason you should partially mix the milk and acid, then set the bottle down and come back to it a few minutes later and complete the mixing, you will find that there will be more or less black sediment mixed with the fat which separates when you have completed the test. So long as the acid is diluted with the entire quantity of milk needed for a test, the action of this acid on the fat is not strong enough to burn the fat when the acid is of the proper strength.

2nd. The speed of a tester having a diameter of 18½ inches should be about 800 revolutions per minute. A table is given in the book "Testing Milk and Its Products" which shows the number of revolutions per minute which testers having different diameters should make. From this table I take the following fignres:

A tester wheel 10 inches in diameter should have a speed of 1,074 revolutions per minute.

A 14 inch wheel should make					909	rev.	per	min.
A 18	"	"	"	"	800	"	"	"
A 20	"	"	"	"	759	"	"	"
A 24	"	"	"	"	693	"	"	"

The speed of the tester is an important matter and although the tests may not be injured by too high a speed, provided the bottles and machines will not break, a too low speed will often give clear separations of fat but fail to show all the fat there is in the milk. It is therefore advisable for anyone having a tester to determine from its diameter the speed at which it should be run. This may be found from the figures given.

3rd. The test bottles ought to be whirled from four to six minutes before hot water is added to them. The safest way is to always whirl the bottles a longer time than necessary rather than to try to economize time by whirling four minutes or less. I should say that an average of five minutes may be accepted as satisfactory in most cases.

When skim milk is tested the bottles ought to be whirled longer than for testing whole milk or cream. The fat in skim milk is in extremely small globules, much smaller than the majority of those in either milk or cream, and in order to separate these fine globules it is necessary to whirl the bottles at the maximum speed and for a longer time than is customary in whole milk testing.

4th. Rennet is usually added to milk in cheddar cheese making at a temperature of 86° F. At this temperature rennet will usually have its normal and maximum coagulating power on the milk. When the temperature rises to 100° the rennet action is diminished and at 120° and above, this will be almost entirely destroyed by the high temperature.

5th. The curd in cheese making is usually heated to about 100° F. A higher temperature than this will have a tendency to injure the texture of the cheese by making it dry and mealy. A lower temperature gives a pasty texture and leaves more whey in the curd than good cheese makers desire to have. The effect of a high temperature on the curd is noticed almost entirely in the texture of the cheese.

Thirteen Acres Support Twenty-nine Dairy Cows.

Many persons think it is impossible to make a living on a small farm except by raising special crops. The fallacy of this is shown by an article by Prof. L. H. Bailey, dean of the college of Agriculture of Cornell University, in the November number of *Country Life in America*, in which are described the operations on a fifteen-acre farm within a mile of the limits of Philadelphia owned by Rev. J. D. Detrich, a minister of the Dutch Reform Church, who came into its possession twenty years ago.

On the fifteen acres about two acres are occupied by the farm buildings, so that really only about thirteen acres are in cultivation. Prof. Bailey says there is no secret about the place, except the old-new secret of executive management in the production of staple and reliable crops and milk from the dairy. Mr. Detrich has shown a clear insight into causes and effects, and pays great attention to details.

He is no fancy farmer, but a plain man of the soil, who reads books and applies the knowledge he gains from them to the practical uses of his little farm. He is a professed "book farmer." Books and nature, and nature and books supplemented each other in the development of the intensive cropping and dairying. Success comes only from the application of knowledge that is reduced to laws preserved as records in book form.

Twenty years ago, when this little farm fell to Mr. Detrich, it supported two cows and a large, fat mortgage. He knew nothing of farming, but necessity drove him to learn it, and he has learned it so well that the little piece now supports twenty-nine Jersey cows and produces a large revenue above expenses every year.

On visiting the farm one sees no display, no fancy or elaborate buildings or devices, no pastures or yards for cattle, no manure piles, no fences, no weeds, no unusual crops.

The entire farm, which is all in one oblong field, can be seen at a glance. The different crops are grown in plots of one to five acres, one plot lying close to another and separated by no dividing fences. The buildings are ordinary, not so good as the average Pennsylvania farms of the better class possess. There is an old fashioned barn with a tin roof, and two sixty-ton silos, The cows are kept in the basement of the barn, which is extraordinarily light, clean and wholesome. The stalls are wide and the walls are whitewashed. The animals are well groomed. The stables and even the animals themselves are disinfected every few days.

The proceeds of the farm, aside from what hay may be sold, come from the herd—in the sale of milk and animals. The milk is sold at 6¼ cents to a sanitarium.

Mr. Detrich describes the details of his work in an article in the *American Agriculturalist* as follows:

"Just before our cattle are milked they are groomed and thoroughly cleaned. The attendant then washes his hands, puts on a gingham apron, and with a clean towel carried in his belt wipes off the teats and udder of the animal before he begins milking. The towel is slightly dampened, so that no dust or other material can be stirred up with it. A clean towel is used at each milking. The milk is removed from the stable as soon as possible after drawn, stirred and set away to cool. The amount of milk produced by our herd varies but slightly winter and summer. It tests about 5.80 the year round. It is not tested by us, but by the parties who get it.

"This is considered very good milk, and we use every precaution to keep it in the very best possible sanitary condition. We insist on handling the cans and having the care of the refrigerator where our milk is kept at the sanitarium. We deliver once a day in cans. The temperature is kept uniform in a refrigerator, kept scrupulously clean, according to our directions. When the milk is

☞ For Sample Copy of Jersey Bulletin address Indianapolis, Ind.

"IT'S UP TO YOU!"

placed in the refrigerator by my man the door is locked and the key turned over to the superintendent in charge. Thus our care of the milk is ended."

Mr. Detrich's cattle do not have the run of pasture. This plan works very well with him, as he gives his animals extra care, roomy stalls and well ventilated quarters. His opinion of exercise for dairy cattle is thus expressed:

"By careful observation the calf the first year is the better for being housed, tethered for an hour or two a day in the open air in nice weather, but if the ground is damp or cold never keep it out long enough to lie down. Damp and cold are enemies, as a rule, to the domesticated animals. The dog and cat will select a rug and mat. In extremely hot and dry weather a dog will take to water and damp places, and so will a cow. The second year the young heifer ought to be on a good, clean pasture. The action of thighs in walking helps to develop the udder, and walking itself helps to prevent taking on flesh. The modern dairy cow is extremely artificial, a fact worthy to be remembered; if turned on the buffalo plain she might revert to what she once was."

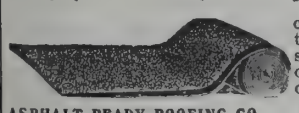
The leading crops are corn, timothy, clover, rye, barley, oats and peas.

Corn is a soiling crop entirely with Mr. Detrich—either fed directly from the field or preserved as silage. The rye is mostly cut green and made into hay, as are also the barley and peas. All feed is cut into one-fourth inch lengths by means of a feed cutter. This enables the animal to use nearly all the material. The small amount of waste is used as litter and absorbs the liquid manure

In Mr. Detrich's crop rotation, corn usually follows rye. Cattle are fed during the summer and fall from the fresh corn fodder, and as soon as the season closes in November the silos are ready for use. Oats and peas are sown together in very early spring. They are made into hay By early August the oat and pea land is ready to be fitted for and sown to timothy and clover. The next year the land gives three mowings of clover and timothy hay.

How long the land remains in grass depends wholly upon how long the yield is maintained. "I saw a wonderful stand of timothy last June," says Prof. Bailey, "on a three year's seeding, which had given three mowings last year." Barley is usually grown from two sowings, made a week or ten days apart. Early in August, the barley is made into hay.

The preparation for all these crops is exceedly thorough. Over and over again the soil is harrowed, even though loose and friable from continued application of stable manure. The manure is never allowed to accumulate at the barn. It is spread on the land every day as it is made; then the seeding is heavy. The land is rich and can support a very heavy growth. Whether the season is wet or dry the crop is assured if once the seed can be got in; and even on so small a farm as this the effort is made to keep a considerable part in grass and clover to reduce the amount of plowing.



The Testimony of a Connecticut Dairyman.

ED. HOARD'S DAIRYMAN: — Inclosed find one dollar for HOARD'S DAIRYMAN to Jan. 1, 1905. You are doing good work for dairymen and they should appreciate it by reading your paper.

Some years ago I heard you lecture at Hartford in this state, to the Connecticut dairymen, and they were much profited. You talk what you know and write what you think. This often exposes errors and leaves the dairymen to do a better and more profitable business. E. P. S.

Andover, Conn.

Mr. Wheaton's Canadian Dairy Notes.

Meeting of Government Dairy Experts—Papers Discussed.

ED. HOARD'S DAIRYMAN:—The second annual Conference of Canadian Dairy Experts took place at Ottawa last week. There were present the leading dairy instructors and investigators from all parts of the Dominion. They were present at the invitation of Mr. J. A. Ruddick, Chief of the Dairy Division, who presided at the conference. The conference was called to discuss the progress of the dairy industry during the past year, and to map out for the future a program of uniform instruction suitable for the whole of Canada.

It will be impossible in a brief article to give more than a short resumé of what took place at a three-day's conference devoted exclusively to addresses and discussions.

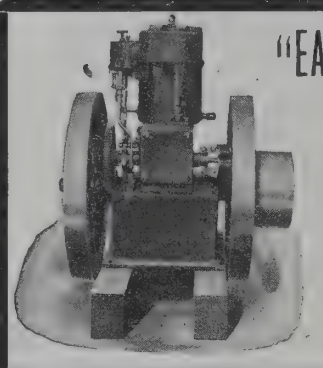
Mr. G. C. Creelman, Supt. of Farmers' Institutes, responded to the words of welcome by Mr. Ruddick. He emphasized the need of greater attention to the farmers' side of the business. Makers and factory owners should so aim to conduct themselves and their factories as to be object lessons for the farmers around them.

How best to secure the co-operation of dairy farmers was the topic of a well thought out address by Prof. Dean There must be something more than self interest to induce men to co-operate. To get farmers and manufacturers to work together to the best advantage, he pointed out that: (1) Manufacturers would have to win the confidence of the farmers by honesty and fair dealing. (2) They should take an interest in the farmer and his work, test his cows and offer him advice and suggestion. (3) They should put men on weigh stand who are polite, accurate in taking weights and samples and capable of winning the confidence of the farmers. (4) They should not always send back milk that was not right, but should endeavor to see the patron who was sending bad milk and convince him of the error of his way. (5) They should pay checks promptly. (6) They might also send a monthly letter to patrons giving seasonable hints regarding the care of milk, feeding of cows, etc., and ask their co-operation in making the best class of goods. (7) In a season of low prices, the manufacturer might make cheese or butter at a lower rate and so bear a part of the loss. (8) The manufacturers might offer prizes to the patrons sending the largest amount of milk or fat.

The growth of the industry this year was well put by Mr. R. M. Ballantyne of Montreal, when he stated that by the end of the season, the export trade in cheese and butter would have to its credit $6,000,000 in excess of any previous season. The high prices of the present season have been largely due to the favorable weather conditions.

The lesson to be learned was that in the future we must not allow hot seasons to injure the trade. Cool curing must be provided for in some way, either at the factory or in the storage of the exporter. Cheese should not be shipped too green. There had been marked improvement in the making of cheese during the past three years, especially in Eastern Ontario. Quebec was improving slowly, and the general run of cheese from that province still sold for ½ cent lower than at the leading Ontario markets. The legislation proposed in Quebec to prevent the granting of licenses to makers, unless they had certificates from a board of examiners, would, Mr. Ballantine thought, effect a much needed reform.

Referring to the government arrangements for refrigerator car service and the provision for inspection of cars at starting points and on arrival at Montreal, Mr. Ruddick stated that there had been complaints of mould on Canadian butter. While a great deal of this was due to the use of bad parchment paper, much was due to lack of care and cleanliness. Refrigerator chambers and cool curing rooms should be disinfected every spring with a solution, such as bi-chloride of mercury, in proportion of 1 to 1,000. Parchment paper should be soaked for 24 hours in a solution of brine made with boiling water, with about 3 ounces of formalin to a gallon of water.



Mr. A. W. Woodward, official referee at Montreal, speaking of the common defects of butter and cheese for 1903, stated that those of cheese were due to bad flavors and bad manufacture, the patrons being usually responsible for the former and the makers for the latter. Off-flavored cheese showing deterioration are quite common. Rancid flavor is also becoming common. Acidy cheese was quite frequent, while quite a large proportion were weak in body, soft and pasty. Open cheese were common, and a great deal of poorly finished cheese was shipped. There had been little difficulty with the make of butter received at Montreal, but there had been a great deal of trouble with flavors.

Mr. E. Bourbeau, Chief Instructor for Quebec, introduced the subject of instructing farmers in milk testing. This lead up to a discussion as to the best way to induce patrons to adopt the system of paying for milk by the Babcock test. The general opinion prevailed that the lack of confidence of farmers in the test was largely due to the inabiliiy or neglect of makers to conduct the test properly.

Speaking of the aeration and cooling of milk, Prof. Dean said, that unless the aerating was done in pure air the practice was of very doubtful utility. The

DON'T BUY GASOLINE ENGINES UNTIL YOU HAVE INVESTIGATED **"THE MASTER WORKMAN"**

A two-cylinder gasoline engine; superior to all one-cylinder engines. Costs less to buy and less to run. Quicker and easier started. Has a wider sphere of usefulness. Has no vibration; can be mounted on any light wagon as a portable. Weighs less than half of one cylinder engines. Give size of engine required. Sizes 1¼, 2, 2½, 4, 5, 6, 8, 10 and 16 horse power. KINNARD-HAINES CO.

MINNEAPOLIS, MINN.

proper cooling of milk was important. The farmer should aim to cool his milk. A better test could be gotten if milk were properly cooled and stirred to prevent the cream rising.

Dr. Connell, of Kingston, in an address on "Sanitation at Factories," said that 60 per cent of the factories in Eastern Ontario were in an unsanitary condition. Faulty drainage, improper construction of factories, particularly in the flooring, bad water and bad whey tanks were the chief faults,

Prof. Gamble, assistant chemist, and Prof. Harrison, bacteriologist at the Ontario Agricultural College, outlined the results of the experiments along dairy lines, conducted at the college during 1903. The former claimed that the alkaline solution will indicate the acidity of milk, cream or whey, and the latter that openness in cheese was often produced by bacteria found in manure and unclean stables.

The question of pasteurization in Canadian creameries brought out a warm discussion. J. F. Filley, Dairy Supt. for New Brunswick, was decidedly opposed to pasteurization and advocated proper feeding of cows, cleanliness in caring for the milk at all stages, and proper methods of manufacture at the creameries. These, he thought, would obviate the necessity for pasteurization, which was difficult to carry out satisfactorily, and was always liable to produce a cooked flavor, which is strongly objected to in the British markets.

Mr Leclair, Quebec; J. A. McTeeters, Guelph; A. W. Woodward, G. H. Barr and Professors Dean and Harrison favored pasteurization so long as we had not ideal conditions for butter making. It helped fresh butter to keep longer and tended to uniformity of product.

After an address by Mr. Ruddick on the cool curing of cheese the conference proceeded to deal with a number of resolutions that had been presented.

The resolutions adopted recommended:

1. The advisability of quoting the price of cheese and butter in fractions of tenths of a cent rather than in halves, quarters, etc., as at present.
2. That there be three grades in the classification of butter and cheese.
3. That makers should be compelled to pass an examination and secure a certificate entitling them to make tests, and that steps should be taken to acquaint patrons with the methods and advantages of testing milk with a view to adopting the Babcock test.
4. That butter and cheese be made in factories that have taken out a license, to be granted only to such factories as are in a proper sanitary condition.
5. That instructors should inspect factory buildings, milk, cream, etc., and assist makers in improving the quality of their products.
6. That the syndicate system of instruction should be extended to all parts of the Dominion as soon as possible, or as fast as competent men can be secured to act as instructors.
7. That factory men be urged to improve their curing rooms or provide some other means of curing their cheese at a cool temperature.
8. That the sciences of bacteriology and chemistry in relation to the dairy should receive more attention by dairymen.

It is reported that Prof. Robertson, who has been recruiting his health at the Isle of Wight since last spring, will return to Canada early in December. He is said to have fully recovered from the nervous trouble which overtook him.

Toronto. J. W. WHEATON.

Beginning the Retail Milk Business.

ED. HOARD'S DAIRYMAN:—In your issue of October 30, a subscriber who is a beginner in the retail milk business wants to know the best methods to be pursued in establishing a milk route Have been in the retail milk business for ten years, and have in that length of time increased my trade from $700 in 1893 to $1,450 in 1903, and in a town of less than one thousand inhabitants.

When you do not buy anyone out, but start the route yourself, it is best to make a canvass of your town; get some customers on every street, and then in traveling the route every day customers will come to you.

There are some rules which must be strictly ahhered to if success crowns your endeavors:

1. You must furnish clean and pure milk, You should be so careful in milking that no sediment will settle in the bottom of a pitcher or tumbler. This is avoided by first brushing your cow's udders and flanks and then wiping them with a dampened cloth or sponge. Arrange your pails with two thicknesses of cheese cloth and absorbent cotton between them, after the manner of H. B. Gurler. This keeps the dust from the air out of the milk.
2. You must furnish good, rich milk that will test not less than four per cent butter fat, and this you must furnish every day. The writer furnishes milk which tests 5 per cent butter fat, and so nicely handled that no town cow, with their careless owners, can compete with him. Result: Less than half the cows in town to-day that there were ten years ago.

A few other suggestions might be pertinent to a beginner: Keep your stables clean and sprinkled with lime. Keep your cows sleek and clean. Invite your customers out to inspect your dairy. Let them know that you keep your dairy in an up-to-date manner. Cool your milk as soon as drawn, so as to give it a good flavor, and nine times out of ten they will qnit the other fellow and come to you.

The writer had milk which was handled as above, keep sweet for 17 days. Some ignoramuses, who never saw a copy of HOARD'S DAIRYMAN, but knew nothing but filth and dirt in dairying, claimed that milk would not keep so long unless it had been doctored by chemicals. But strange to say the pure food inspector was in our county and arrested two or three retail dairymen, and while here visited our little town and made no arrests.

Have rented a dairy farm in a town of five thousand inhabitants, and will start another retail dairy. Have now forty-two head of Jerseys, on ninety-six acres of land, and must either start another dairy or sell some cows. The latter I do not wish to do so long as I read HOARD'S DAIRYMAN, and learn how to handle them. In this dairy, I shall have the board of health visit my stables and see that everything is kept in a sanitary condition.

Now, in conclusion, let me say to my friend: Read HOARD'S DAIRYMAN. After you have once read it, then re-read it, After you have re-read it, then read it over again, so you will be sure and remember all the essential points, and you are on the high road to success, and your neighbors will speak well of you when you die, if not before. J. A. S.

New Vienna, Ohio.

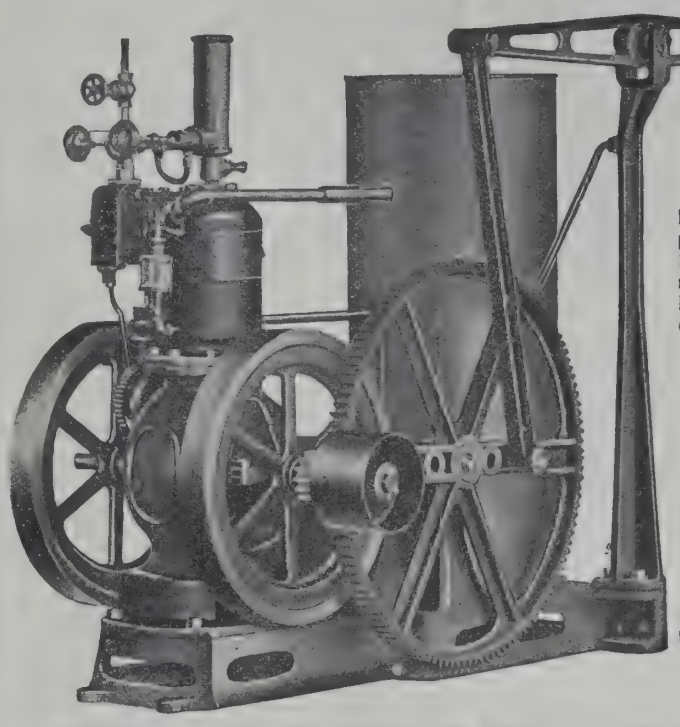
Value of Cows Fixed by Capacity.

ED. HOARD'S DAIRYMAN:—The scale of prices found by Prof. Wheaton, page 844, looks interesting. Of course everyone will recognize that the value of a cow should rise as the net income of her product rises above cost of maintenance and insurance, checked by a fair balance to sinking fund.

Has Prof. Wheaton given in his rates of rise in value per capacity, any attention to this element of risk? This particular kind of cow that comes to be worth anywhere up to ten times as much as her commonplace sister, may be more liable to disorder because she has a high pressure life work to perform and must neccessarily be fed more and better, to produce up to her capacity.

We have had some experience in developing some figures in this line from results of careful feeding where amount and cost of feed was accurately kept. After a three years' trial, one cow was found to have cleared a net profit of $69. Her best year's record was approximately 7,000 pounds of milk and 400 pounds of butter. Now, according to Prof. Whea-

The "Penny Wise and Pound Foolish"



Policy has an apt illustration in the man who buys a CHEAP gas or gasoline engine. Unreliable service, frequent and expensive repairs, wastefulness in fuel and short life offset many times over, the small saving in first cost. The "OTTO" is the original and BEST. Suppose it does cost a little more money, the extra dollars are well invested. 70000 users throughout the civilized world support us in this claim.

ton's result, this cow should have been worth $50. Query. What value should have been placed on this cow?

We should like to see the reasoning which leads up to the values by capacity and to know whether they are raised by the possibilities of posterity or lowered by cost of insurance.

Maine. F. E. E.

Paying Patrons of Cheese Factory.

ED. HOARD'S DAIRYMAN:—In your issue of the DAIRYMAN of Oct. 30, 1903, my attention was called to an article of A. W. S.'s, in which the plan of paying the patrons by the "butter fat" was set forth. I was requested to write the plan of this, The Prairie City, Mo., Cheese Co., paying it patrons, one that has been in use for over 18 months, and which has given general satisfaction

The directors have adopted the Babcock milk test, and were then at a loss to know how to pay by it. I was called upon and prepared the following plan, which they adopted and now use.

PATRONS.	Butter fat.	Lbs. milk furnished. Cheese per 100 lbs. milk.	Amount of cheese. Price per lb. cheese.	Dividend.
G. Hirschi.....	3.4	4000× 9.9	399.0×10	$ 39.90
C. Smith.....	3.0	2500× 9.2	230.0×10	23.00
J. B. Durand..	3.2	4058× 9.5	385.5×10	38 55
A. D. Hyde....	4.0	3021×10.8	326.3×10	32.63
C. Hirni.....	3.8	1824×10.5	191.5×10	19 15
J. Yass.....	3.7	9670×10.3	996.0×10	99.60
Total.....	.....	.....	2528.3	$252 83

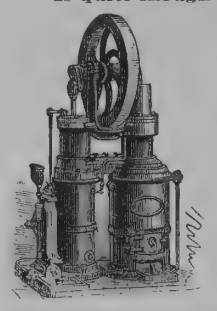
Dividend, $252.83÷2528.3=10c, price per lb.

Rockville, Mo. J. N. P.

CONCERNING OUR ADVERTISERS

The price of coal would not bother you so much if you had the right kind of a stove. The average stove or kitchen range wastes three or four tons of coal every year. It is said that the old reliable firm of J. A. Tolman Co., Chicago, sells direct to user, at an amazingly low price, more first-class stoves and ranges than any other manfacturer in the United States. There is great satisfaction in dealing with a reliable company and one that absolutely guarantees satisfaction, If you need a heating stove or kitchen range for hard or soft coal at about half the usual price, and one that will save its cost in fuel in a few months, see advertisement of above firm in this issue.

ILLUSTRATION



A GEORGIA CORNFIELD.

The accompanying cut was made frem a photograph of a Georgia cornfield. Not all the cornfields there make such crops, but this shows what a Georgia farmer can do when he tries. According to the census, the average value of the farm products per acre of improved land for 1900 was $8.68 in Georgia, $8.89 in Iowa, $9.35 in Indiana, $9.52 in Illinois, and $9.29 in Michigan. While the value of crops per acre was not very different there was a great difference in the cost of the farm. In Georgia the average farm has 117 acres valued at $1,016; in Illinois 124 acres valued at $7,588; in Indiana 97 acres at $4,410; in Iowa 151 acres at $8,023; in Michigan 86 acres at $3,396. The Georgia farm cost from a fourth to an eighth of the cost of a western farm, and produced approximately as much per acre. Why are Georgia lands so cheap? Because, until recently, the tide of immigration was westward and not southward. Iowa and Illinois, each with less land than Georgia, has nearly three times as much under cultivation. The same is true, in varying degree, of other western states. Georgia has not filled up and her lands are cheap. But the tide is turning, and before many years have passed, Georgia lands will be occupied and prices there will be as high as they are in the west. Georgia has a delightful climate, and conditions are very favorable for the farmer. For a moderate sum you can buy a farm which will produce good crops. If interested, write for booklet M, Greater Georgia Association, Atlanta, Georgia.

VETERINARY.

Queries in this department answered by DR. A. H. HARTWIG, Watertown, Wis.

Swelling in Quarter.

A 5-year-old cow had some kind of a swelling in the left hind quarter of her udder. Has been that way for about 6 weeks, about once a week off and on. M. C. D.

Humboldt, Neb.

ANLWER.

Give the cow 2 drams of iodide of potash in her drinking water, at least one hour before feeding, morning and night. Rub the quarter with the following: Dilute alcohol 12 oz., Tr. of iodine 2 oz. and oil of turpentine ½ oz. Apply after each milking to the parts affected.

Tuberculosis.

Can you give a description of symptoms that would enable a layman to determine whether his cattle were infected with tuberculosis?

Vashon, Wash. L. B. A.

ANSWER.

The only visible symptoms of this disease to be noticed by a layman are: general unthriftiness; in some cases, a deep, hollow cough, a staring coat, and sometimes enlargements may appear in any part of the body, particularly the glands; the above would indicate a chronic case. To detect the disease in its earlier stages, it is necessary to apply the tuberculin test. This should be done by an experienced veterinarian.

Lymphangitis.

Have a mare that has had a swollen hind leg for three years. It gets better at times, and then swells again. J, E. S.

New Vienna, Ohio.

ANSWER.

This trouble is commonly known as chronic big leg. It will partially disappear when the animal is worked, but only to return when rested. You may expect the leg to become inflamed at any time when the animal has been rested and well fed, and each such attack will increase the enlargement. Never feed full rations, when the animal is at leisure in the barn; if possible let her run in a paddock during such periods of idleness. Big legs of long standing cannot be cured, but you may avoid subsequent attacks.

Trocar and Cannula for Bloating—Ice-Cream.

You say that every dairyman should supply himself with a trocar and cannula. Can you tell me where they can be gotten, together with full instructions how to use the same, also the price of the same? Is there any book on the treatment and handling of cream for manufacturing of ice cream? If so, where can it be had and at what price? J. T, E. T.

Summerville, S. C.

ANSWER.

The trocar and cannula is handled by almost any hardware dealer and sometimes by druggists. If your dealers do not keep them on hand, they can get them on short notice. Insert the instrument in the left side at the most prominent portion of the bloat, which is midway between the point of the hip, the last rib and the transverse process of the lumbar vertebrae.

It is best to cut through the skin with a sharp knife before inserting the trocar, which is to be directed downward, inward and forward.

We have no personal knowledge of books on this subject, but would recommend writing to the Confectioner and Bakers' Supply Co. of Chicago, Ill., who are dealers and manufacturers in ice cream supplies, and will probably be able to recommend a practical book on the subject.

Millard F. Sanders
7 Irving Park Glenville Ohio

September 7, at the Fasig-Tipton sale at Sheepshead Bay, a yearling by Esher-Excellensa was being sold by Mr. William Easton, and when the animal was led into the ring he said—"This horse has been suffering from a bog spavin, of which practically no trace remains. He was treated with that remedy called 'Save-the-Horse,' which all of you know, and it did save the horse; that is, it cured him. Now, you know lots of great horses, Morello and others, were successfully raced, and there is no reason to expect that this colt will ever take a lame step." The bidding opened then at $250, and the colt was sold for $800 to Mr. J. D. Smith.

"Private Stables Jas. Galway, Race Track, Saratoga, N. Y.

I got a bottle of "Save-the-Horse" first of Moseman & Bro. of New York and used same on ringbone, curing it entirely. I next used 'Save-the-Horse' on two splints and cured them. Have also used it on a strained Pastern Joint, which made horse very lame; it cured this also. I predict a great output of 'Save-the-Horse.' It has never failed to cure any case I used it on." EDWARD FEAKS, Trainer for Jas. Galway, of 312 West 56th St., New York, the millionaire owner of Meltonian and many other noted horses.

Cured horses are absolute certainties as to the possibility of the remedy for your own case. Such results as above by men whose reliability can be readily ascertained, have carried "SAVE-THE-HORSE" over skepticism, prejudice and uncertainty. Send for booklet and copy of written guarantee, which is as binding to protect you as the best legal talent could make it. No man need see his horse suffer and become incapacitated.

"SAVE-THE-HORSE" Positively and Permanently Cures BONE and BOG SPAVIN, THOROUGHPIN, RINGBONE, (except low ringbone,) CURB, SPLINT, CAPPED HOCK, WINDPUFF, SHOE BOIL, WEAK and SPRAINED TENDONS and ALL LAMENESS. Cures without scar, blemish or loss of hair. Contains no mercury or poisonous substances. Can apply in all conditions and extremes of weather. Horses may be worked as usual.

$5.00 per bottle. Written guarantee with every bottle given under seal and signature, constructed solely to satisfy and protect you fully. Need of second bottle improbable, except in rarest cases.

$5.00 per bottle at all druggists' and dealers', or sent express prepaid.

TROY CHEMICAL CO., TROY, N.Y. Also manufacturers of **Veterinary Pixine.**

CURE "THE" COW
—NO CURE, NO PAY.—

WRITE, giving symptoms of animal sick, and will ship you by express quantity sufficient to cure your cow with full directions for use. If I do not cure the animal the advice and Cure "the" Cow costs you nothing except the express charges. If I do cure it you can send Postal order for cost of the remedy—$2.00 per puart, $3.50 per half gallon, $6.00 per gallon and pay for what you use. Generally half a gallon cures the worst cases. Give Postoffice and Express office with your order. Address

Silage.

Its Special Value for the Dairyman.

[C. P. GOODRICH before Wisconsin Farmers' Institute.]

Silage has a greater feeding value than the same forage would have if cured by drying in the field, because it is more digestible. There is more to be gained by siloing corn than by siloing crops that have finer stems that can be more quickly dried. There is usually great loss in field curing the fodder part of corn. It takes so much time that much of the leaves and finer parts becomes weather beaten by rain and wind, and is wasted; and also much of the leaves is frequently, when very dry, crumbled up and lost by handling. In drying, the thick stalks become woody and indigestible and are not eaten by stock. The ears of corn, if well matured before frost, cure well in the field, but even these are better if put in the silo at the right stage, because they remain soft and are more easily masticated and better digested than if dried. Of the fodder part of the corn, one-half of it is usually lost and wasted in the curing and feeding. It takes less labor to make silage of a corn crop than it does to prepare it for feeding in any other way.

Stock do better if they have some dry feed and some succulent feed. From what I have said it will be seen that corn is the best crop of which to make silage, while hay of some kind should be used for the dry fodder.

Corn silage is very palatable. All kinds of stock eat it greedily and prefer it to almost anything else. They eat it all up and do not leave even the thick butts of the stalks.

Silage is especially valuable to the dairyman who is carrying on winter dairying, increasing the flow of milk much over what can be obtained by dry feed alone. Fattening cattle make more rapid gains when a part of their ration is silage. Young cattle and sheep are better and more cheaply fed, when a part of their winter feed is silage. Some men have fed it to horses and report good results.

Silage is not only good winter feed, but there is nothing better to feed dairy cows to help out the pasture in times of drouth and short feed. In fact, silage is so palatable, and cows like it so well, that they will eat some of it with great relish when they have good pasture. There are many dairymen who feed silage as a part of the daily ration every day in the year, and they are some of the most successful dairymen in the country.

Silage seems to be a sort of appetizer. It is not only easily digested, but it appears to aid in the digestion of other foods fed in connection with it, Animals consume more food when part of the daily ration is silage and therefore make faster gains if beef animals, and give more milk if dairy cows.

No better milk is produced in the country than that of many herds that are fed silage every day in the year. H. B. Gurler, of Illinois, who milks 200 or more cows, and many other dairymen who produce certified milk, every quart of which is sold for twelve cents, feed their cows silage every day as part of their ration. Many of the best dairymen in the country, who are making dairying the most profitable, do not pasture at all, but feed silage in connection with other feeds, the year round.

There are many men who denounce silage and say it is not fit for cows to eat, and claim that it injures the cows and injures the milk and other dairy products. But they are men who know nothing about it; they have never had a good silo or if they have had a good one, have never had good silage because of not putting in the forage in a proper manner or in proper condition. It is true that rotten or damaged silage is not fit for cows to eat, and will injuriously affect the flavor of the milk. The same is true of any moldy, musty, or damaged feed if given to cows.

A silo may be filled quickly or slowly, as circumstances permit, with equally good results. It may be filled in one day and be all right. In that case, the silage will settle a great deal in a few days, and if the silo is to be anywhere near full, more must be put in, filling it to the top. If the silo is filled slowly, taking several days to complete the job, it will settle as the work progresses and be all right, provided that there is not a stop in the filling of more than one or two days at a time. If there is, the silage will begin to mold on top, and that injures it.

The kind of corn to raise for silage is that which will produce the greatest amount and value of food per acre, taking both ears and fodder, that will be reasonably sure to sufficiently mature in the locality where it is raised,

The stage of maturity at which it is best to put in the silo is when the corn contains the most feeding value, taking the whole plant, stalks and leaves, and ears. At that time the corn is begining to glaze if it is flint corn, or dent, if it is dent corn; the lower leaves are begining to turn yellow or white and on some of the earliest ears the husks are turning white. If the corn is more immature than this the silage will be quite sour, will lack the nutriment it would have at a later stage and not be as valuable feed. If the corn is too ripe and dry it will not heat up hot, will mold and be damaged, In case the filling can not be done until the corn is too ripe and dry, this can be remedied to a great extent by having it so arranged that water can be sprayed onto it as it goes up the carrier when filling the silo, enough to supply the needed moisture.

Various ways have been tried of covering the silage after the silo was filled to prevent the spoiling of the silage on top, but it has been found that nothing is better or less expensive than to put on water enough to thoroughly wet the top of the silage and have enough so that it runs down between the silage and the sides of the silo. Many avoid all loss from damage on top by beginning to feed immediately after filling, thus giving it no time to damage. The feeding should always be done from the top, taking about two inches from the entire top each day. If the feeding is done too slowly and part of the surface is left exposed to the air for two or three or more days then the stock will have partially damaged silage all the time.

The feeding of silage materially reduces the cost of producing dairy products, because fewer acres of land are required to keep a given number of cows, less work and expense is needed to prepare the corn for feeding, and, last, but by no means least, cows can be made to produce much more during the year by having them fresh in the fall and feeding silage in winter.

J. A. M.'s Octagon Silo.

ED. HOARD'S DAIRYMAN:—Regarding J. A. M.'s octagon silo, which he claims can be built for $25, the construction seems to be easy enough, but I fail to see how it can be put up for anything less than $75 or even $100. For the dimensions mentioned it would require at the very least 1,800 sq. feet of lumber which, if dressed one side, will cost from $30 to $40 per thousand; say $75 to $80 for lumber alone, besides the 2×7 joists, cement, nails, etc.

I should be glad to hear from J. A. M. with further particulars. Perhaps the DAIRYMAN'S type setters are responsible for this low figure,

The stave or tub silo is cheap and gives satisfactory results. S. GILLES.

Ahuntsic, Canada.

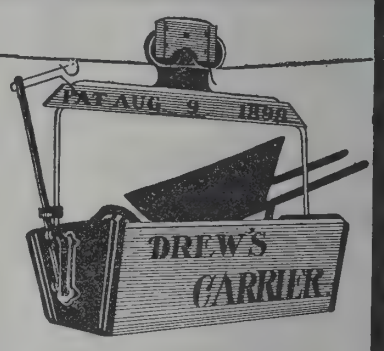
The question of cost of lumber is for J. A. M. to settle. The DAIRYMAN'S type setters have followed copy and made no mistakes. ED.

Made for the Man Who Wants the Best.

The Great Western Manure Spreader

Endless Apron

spreads all kinds of manure, fresh, well rotted, fine, coarse, hard, mixed, full of straw, full of corn stalks, etc.



Spreads as much manure in one day as twelve men can load and spread by hand and the job is much better when done. Spreads the largest load a team can haul in 2 to 4 minutes. Makes manure go three times as far and at the same time produce better results.

REGULATED to spread much or little while in motion. Puts it on thick on poor spots—3 to 25 loads per acre. **ENDLESS APRON**—always ready to load. No turning back into position with crank.

COMBINED HOOD AND ENDGATE keeps manure away from beater while loading and acts as hood in spreading. Catches all flying sticks, stones, etc. Front wheels cut under, and machine can be turned in its own length. Capacity 30 to 70 bushels. It saves **time, labor and money** and will double the crop. Makes all manure so fine and spreads it so evenly that it is immediately available for plant food. **SEND FOR FREE CATALOGUE** giving illustrations and full descriptions. Tells also how to apply manure to secure best results; **FAT STOCK SHOW,** call at 25 Exchange Ave., Stock Yards, or at our office, and see the or if you come to the spreader. We keep a spreader at both places permanently.

SMITH MANURE SPREADER CO., 16-18 S. CLINTON STREET, CHICAGO, ILL.

GOODBYE, WHEELBARROW

Every farmer who gets a Drew Elevated Carrier has no more use for the barnyard wheelbarrow. The

DREW ELEVATED CARRIER

will carry the manure from the stables to any point in the barnyard, drop it, return automatically, ready for another load.

It is self operating — it turns curves and switches—dumps its load in yard or wagon. Besides carrying manure you can use it to convey ensilage, feed, grain, potatoes, cans of milk, from one point to another. It works so simple and easy that any man or boy can run it.

THE DREW ELEVATED CARRIER

carries labor off from the farm—it is the farmer's labor and money saver. No trouble to put them up—no trouble after they are up.

It leaves barnyard free from posts—keeps the barnyard clean and free from litter. Get one and

"WATCH IT WORK FOR YOU"

Valley Farm Albina 60829—2 years 1 month, 4 days commencing 19 days after calving: Milk 251.1 lbs., butter fat 8.588 lbs., equivalent butter 10 lbs., 0.3 oz. Owner, Don J. Wood,West Winfield, N. Y.

Durkey Winsome DeKol 57447—2 years, 2 months, 13 days, commencing 15 days after calving: Milk 263.4 lbs., butter fat 8.520 lbs., equivalent butter 9 lbs., 15 oz.

Jane DeKol Manor Beets 59625—2 years, 1 month, 8 days, commencing 28 days after calving: Milk 245.2 lbs., butter fat 8.147 lbs., equivalent butter 9 lbs., 8.1 oz. Owner, John B. Marcou, Princeton, Mass.

Princess Calamity Jane Colantha 58893—2 years, 2 months, 19 days, commencing 21 days after calving: Milk 240.6 lbs., butter fat 8.043 lbs. equivalent butter 9 lbs. 6.1oz. Owner, John B. Marcou, Princeton, Mass.

Pet DeKol Pieterje 57445—2 years, 2 months, 28 days, commencing 10 days after calving: Milk 256.3 lbs., butter fat 7.937 lbs., equivalent butter 9 lbs. 4.2 oz.

Wayne Pauline DeKol 2d. 55840—2 years, 7 months, 9 days, commencing 16 days after calving: Milk 255.3 lbs., butter fat 10.391 lbs., equivalent butter 12 lbs., 2 oz.

Comedia Soldene Artis 55712—2 years, 10 months, 17 days, commencing 9 days after calving: Milk 345.7 lbs., butter fat 10.061 lbs., equivalent butter 11 lbs. 11.8 oz. Owner, T. A. Mitchel, Weedsport, N. Y.

Eva Von Holingen DeKol 60470—2 years, 1 month, commencing 32 days alter calving: Milk 305.1 lbs., butter fat 10.032 lbs., equivalent butter 11 lbs. 11.3 oz .Owner, A. A. Cortelyou, Neshanic, N.

Jannek Belle DeKol 60831—2 years, 8 days, commencing 20 days after calving: Milk 288.2 lbs., butter fat 9.971 lbs., equivalent butter 11 lbs. 10.1 oz. Owner, Don J. Wood, West Winfield, N. Y.

Grindetia DeKol Boon 61129—2 years, 18 days, commencing 31 days after calving: Milk 285.7 lbs., butter fat 7.750 lbs., equivalent butter 9 lbs. 0.7 oz.

Dossie Pietertje Maid 61298—1 year, 11 months, 23 days, commencing 22 days after calving: Milk 225.7 lbs., butter fat 7.742 lbs., equivalent butter 9 lbs. 0.5 oz.

Inka DeKol Hamilton 57449—2 years, 3 months, 2 days, commencing 28 days after calving: Milk 264.8 lbs., butter fat 7.737 lbs., equivalent butter 9 lbs. 0.4 oz.

Urica Netherland Lady Mercedes 57426— 1 year, 11 months, 22 days, commencing 19 days after calving: Milk 226.8 lbs., butter fat 7.424 lbs., equivalent butter 8 lbs. 10.6 oz.

S. HOXIE, Supt. of Adv. Reg.

Yorkville, N. Y., Oct. 30, 1903.

The Churn.

The Indiana Experiment Station in Bulletin No. 96 discusses in a practical way the kind, care, operation, temperature, etc., of churns. It says:

The kind of churn which has no inside fixture, but dashes the cream from one side or end to the other by the motion of the churn, has proved most satisfactory.

The paddles, dashers, etc., of whatever pattern, are apt to hurt more or less the texture of the butter, and also cause a loss of butter in the cream, which adheres to them and to the corners of the churn, especially when the cream is a little thick.

When the churning is done in such a short time as is claimed by admirers of many so-called improved churns, it is usually at a sacrifice of butter-fat left in the buttermilk, even though it may not be apparent to the eye.

Wooden churns are to be preferred to metal; because of their getting loose in dry weather if not used frequently or properly taken care of, a steel barrel-churn, tinned inside and painted outside, has been put on the market. The objections to it are that the cream warms up more easily when the room is warm, and more butter will adhere to it than to the wood. Care must be exercised to wipe it dry or it will rust. On the other hand, the cream might be kept in it until

Weight

Salt that makes weight makes money for the butter maker. DIAMOND CRYSTAL SALT—"*the Salt that's ALL Salt,*" made weight for one creamery at the rate of $8,000 a year in additional profit. The secret is simply this: Whatever weight you add in DIAMOND CRYSTAL SALT, *you obtain in increased weight of butter.* Its pure, dry flakes dissolve completely and become a part of the butter, instead of being washed out, or adhering to the worker rolls, like common, gritty, flinty salt. Our illustrated booklet "Just Salt" is just the thing for dairymen. Free on request.

DIAMOND CRYSTAL SALT CO., ST. CLAIR, MICH.

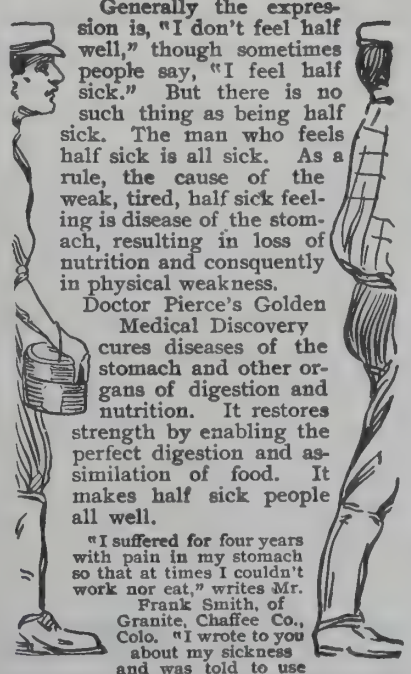
BUTTER FOR UNCLE SAM

THE CONTINENTAL CREAMERY COMPANY TOPEKA, KANSAS

Has been awarded the contract to supply the United States Navy with half a million pounds of butter for the ensuing year.

For this purpose only the best quality of butter is used, and its keeping quality must be made of the very best, owing to the fact that the entire year's supply must be made within a few months and it is carried through all conditions of climate.

The government has made a thorough study of supplying butter to suit the requirements of the Navy and as a result it has laid down some very exacting standards to which those who bid for these contracts must comply. One of the few concerns who can fulfill these requirements is the Continental Creamery Co. and it was awarded this contract, which is the biggest single order for butter ever filled.



This company produces the greatest quantity of fancy creamery butter in the world, all of which is made from pasteurized cream. Surely it knows something about making good butter. It also knows from actual experience and the investigations of its chemists, that one of the factors in making good butter is

168 DUANE STREET, NEW YORK.

HALF SICK

Generally the expression is, "I don't feel half well," though sometimes people say, "I feel half sick." But there is no such thing as being half sick. The man who feels half sick is all sick. As a rule, the cause of the weak, tired, half sick feeling is disease of the stomach, resulting in loss of nutrition and consquently in physical weakness.

Doctor Pierce's Golden Medical Discovery cures diseases of the stomach and other organs of digestion and nutrition. It restores strength by enabling the perfect digestion and assimilation of food. It makes half sick people all well.

"I suffered for four years with pain in my stomach so that at times I couldn't work nor eat," writes Mr. Frank Smith, of Granite, Chaffee Co., Colo. "I wrote to you about my sickness and was told to use your medicines, which I did with good results. I only used four bottles of your 'Golden Medical Discovery,' and must say that I am entirely cured and feel like a new man, and I can highly recommend your medicine to any sufferer."

"Golden Medical Discovery" contains no alcohol and is entirely free from opium, cocaine and all other narcotics. It is strictly a temperance medicine.

Accept no substitute for "Golden Medical Discovery." There is nothing "just as good" for diseases of the stomach.

The "Common Sense Medical Adviser," one thousand and eight large pages, in paper covers, is sent *free* on receipt of twenty-one one-cent stamps, to pay expense of mailing *only*. Address Dr. R. V. Pierce, Buffalo, N. Y.

Let Them Help Themselves.

They'll not take too much, and they'll get it as they want it. Don't force animals to eat salt when they don't require it, by mixing with food.

are all salt, no impurities. Improve the quality and yield of milk. A modern convenience, always present, animals never neglected, and costs for each only about a nickle a month. See how they enjoy helping themselves when you place it within reach. For all stock. Buy of dealers or send for free booklet to

Belmont Stable Supply Co., Brooklyn, N.Y.

GRINDS Ear Corn, Shelled Corn, Oats, Rye, Barley, Kaffir Corn, Etc., fine or coarse, for feed or family use. Has shake feed which insures regular and even work.

$27 to 45.

BUHRS are made of white metal, so hard that neither file or tool will touch them. They will open and allow nails or other hard substances to pass through without breakage. We furnish this mill with or without crushers and elevators as ordered.

Don't Buy Until You Get our Catalogue.

CAPACITY 10 to 45 bus. per hour, according to power used, kind of grain and fineness you grind. The only mill which grinds ear corn and all other grain successfully, with 2, 4 or 6 horse power.

SIZES. Made in 3 sizes for power up to 12 horse, and we guarantee it to grind more ear corn than any mill made with same power, because crushing and grinding plates are on separate shafts reducing friction.

OTHER STYLES. We have 41 styles and sizes of grinders, adapted to power wind mills, engines and horse powers of all sizes. We have powers of all kinds for driving all kinds of machinery.

CUT THIS AD OUT and send it to us and we will mail you free our Special Farm Machinery Catalogue. It illustrates and describes all these grinders and hundreds of other things for farm use

MARVIN SMITH CO., CHICAGO, ILL.

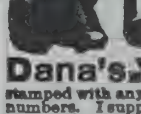
MOST HEAT=LEAST FUEL

Largest firebox. Least expense and trouble. Burns wood, cobs, straw, etc. Jacket and bottom of heavy galvanized iron (double rivited.) Two heavy cast iron plates 8 inches apart compose the double top (our patent.) This double top space connects with manhole and smoke-stack, forming dead air compartment and keeping fire below water surface which saves the heat.

We have a valuable book called "Warm the Water and Save the Feed," which we will send you FREE. It's worth $1.00.

WINONA TANK HEATER

is unconditionally the best heater made. Price $6.50. We pay the freight. Address



WINONA TANK HEATER CO., 82-2ND ST. WINONA, MINN.

The "STAY THERE"
Aluminum Ear Markers

are the best. Being made of aluminum they are brighter, lighter, stronger and more durable than any other. Fit any part of the ear. Nothing to catch on feed trough or other obstacle. Your name, address and any series of numbers on each tag. Sample tag, catalogue and prices mailed free. Ask for them. Address

C. H. DANA, Main St., West Lebanon, N. H.

enough is secured for a churning, making one less vessel to care for.

The size of the churn should be such that it will never be filled over half full, and better if only one-third full. Where the ordinary churning amounts to from two to five gallons of cream, a fifteen-gallon churn is a desirable size.

The speed of a barrel or box churn which revolves, should be sufficient to carry the cream to the highest point, allowing it to fall the length of the churn. If it is turned too fast, the cream will remain in the ends; if too slow, it will slip around and churn slowly, The agitation which results from concussion is more desirable than that from friction.

The time required for churing depends on the ripeness of the cream, the temperature, the fullness of the churn, the amount of agitation and the richness of the cream, and to a lesser extent to the period of lactation and feed. Quick churning usually means large loss of butter in the buttermilk. Under ordinary conditions from twenty to forty minutes is a reasonable length of time for churning, and no objection to an hour if firm butter and thorough work are desired, especially if the churning is done with other than hand power.

The only rule in regard to temperature which can be given is to "churn at as low a temperature as possible, and have the butter come in a reasonable time." A high temperature makes quick churning, large loss of butter in the buttermilk and soft butter; a low temperature requires a longer time, makes a firmer butter and reduces the loss in the buttermilk, While most cream can be satisfactorily churned in from twenty to forty minutes at some temperature between fifty and sixty degrees Fahrenheit, some unusual condition may require a little higher temperature or longer time. In the Experiment Station dairy from fifty-four degrees to fifty-six degrees is the usual churning temperature. When gluten meal or feed is fed, the churning temperature may be lowered from two to four degrees, while if much cotton seed meal is fed, it may be raised a little if the butter is slow in coming.

The variations in the churnability of cream from different cows and herds, from the same cows at different seasons of the year and varying stages of lactation, require some variation in the churning temperature. Use a thermometer; then if the butter comes quick and soft, lower the temperature of the cream next time. It is very desirable that the cream be held at the churning temperature for at least two hours previous to churning.

The Old, Old Question.

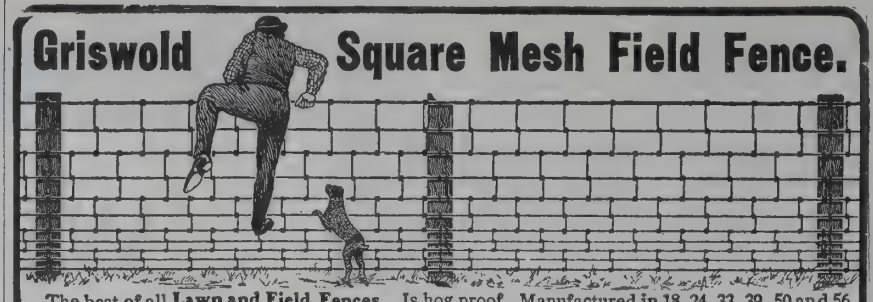
Does Feed Vary the Per Cent of Fat in Milk?

ED. HOARD'S DAIRYMAN:—At a meeting of a farmers' society a few nights ago there was quite a discussion as to whether one could increase the per cent of the butter fat in a cow's milk. Some maintained that you could and gave as evidence that they had cows that were fed on straw and other poor feed, and the milk they would give would have very little cream and the cream would make white, poor butter, while the same cows fed on unthreshed oats—although not giving any more milk—there would be double the cream, and it would make good, solid, well colored butter. I would like you to explain the question for me.

I would like also to have you make up a balanced ration of the following: Timothy hay, unthreshed oats, oats and wheat mixed, cut green. Bran, $22 per ton; shorts, $23; middlings, $24; cotton seed meal, $32; oats, 40 cents per bushel.

Would it pay to feed a ration of the above to cows if you did not live near a good market?

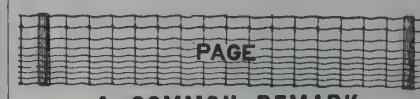
What price would one need to get for butter to make it pay to feed a ration of above if he has the right kind of cows?



Now, you will greatly oblige a recent subscriber to your valuable paper if you would answer these questions.

Iron Ore, N. S. A. W. M.

Carefully conducted experiments where the milk has been accurately tested for butter fat, have failed to show that change of feed has any marked effect upon the per cent of fat. This is contrary to the popular belief, but we consider it correct. Change of feed will doubtless effect more or less change in the color and texture of the resulting butter.



But it is also true that if a cow has been fed a starvation ration of straw, etc., so that her milk flow is almost stopped, such milk will have very little fat, and the

Griswold Square Mesh Field Fence.

The best of all **Lawn and Field Fences.** Is hog proof. Manufactured in 18, 24, 33, 39, 50 and 56 inch heights; in 20 and 40 rod rolls. The narrow widths can be supplemented to any height desired by Barbed or Plain wire, or two strand twisted Cable wire. Manufacturers of **Diamond Mesh Fence. The First Thing to do

If you are going to buy any fence this season, the first to do, for your own protection, is to send for **FREE FENCE BOOK**

It tells all about **ADVANCE FENCING** which is without question of doubt the best fencing on the American market. It also tells how you can buy this fence **Direct from the Factory** at wholesale prices, freight paid to your station, doing away with all dealer's and jobber's profits. It also tells how **Advance Fencing** is sent to you **ON 30 DAYS' FREE TRIAL** so that you may have every opportunity of being perfectly satisfied that you have the best that your money can buy. Our **Fence Book** gives description and prices on twenty-three different styles of woven wire fencing, a fence for every need on the farm, garden or poultry yards, and also tells why **Advance Fencing** is the most desirable kind to have on the farm. It has many points of merit. It has no loose ends, the stay wire is not cut at the top and bottom as in other fence, but is woven into the top and bottom strands between the stays. The **Advance Tie** is perfect, the stays cannot slip. **ADVANCE FENCE** is made of heavy material throughout. You should send for our **Fence Book** at once, it is FREE. Your name and address on a postal card, directed to us will bring the **Fence Book.** It pays to keep posted. Write today. **Do It Now.**

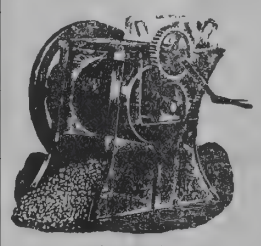
TRADE MARK BESTOV

DAIRYMEN'S SUPPLY CO., Dept. Philadelphia, Pa.

Buy You a Ticket to CROOKSTON, MINN., and call upon

The Polk County Land & Loan Company



For Choice Red River Valley Farms. They pay railroad expenses if you buy from them. A few good bargains.

360 acre farm, 4½ miles from Crookston, Minn., a city of 7,000 inhabitants, and 2½ miles from the State Experimental Farm. This is a photograph of the buildings as they are today: House is 16x24 1½ stories with an L 14x22, and a wood shed in connection 20 feet square, all on a brick foundation. Barn 28x48, with a lean to 16x48, sheeted both inside and out. Two granaries, one 14x80, and the other 14x42. The buildings are all well painted and in very good repair, and has a fine artesian well. Every acre of this farm is under a high state of cultivation, and is well drained by a slight ravine running through the farm merely sufficient for self drainage. The soil is a rich, deep black loam with a clay sub-soil, and in every respect is considered to be one of the best farms in that vicinity. Our price on this farm is $35.00 per acre.

This is a **320** acre farm about 2½ miles south of the city, this farm is quite well improved, has a very good house of about seven rooms, 1½ stories, barn large enough for ten head of horses, also a good granary, pasture and an artesian well, also has a good well at the house, good grove around the building, This is a very choice piece of land for the price $32.50.

160 acres north-east of the city; this is all hay land, and located in a German settlement, the surrounding country is nearly all under cultivation; we consider this a good piece of land for an investment, this could all be put under the plow, if desired. Price $19.00 per acre.

Creasey Ice Breakers

Dairymen and shippers of milk and cream find them most efficient, economical machines, and the greatest savers of time and ice. Easy to operate. Rapid cutters. The design is right.

Made in sixteen sizes to suit every requirement. Send for catalogue "11-B" which gives full particulars.

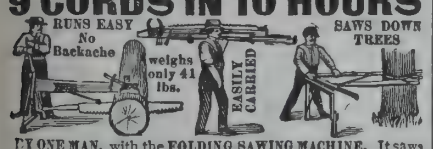
and ask us to mail you our new illustrated stove catalogue, and we will forward postpaid our complete catalogue of stoves and ranges, which illustrates and describes everything in the stove line for cooking and heating worthy of your consideration—all at prices decidedly low. We sell only the best grades, avoiding the very cheapest. If you want an honestly made stove you cannot afford to place your order until you have seen our stove catalogue. A postal card will bring it.

$4.00 as here illustrated.

$3.20 is our price for a good stove with a 9¾-inch firepot. It is a much better stove than some firms sell at a higher price, but if you want the best send for our stove catalogue and read about our famous Home Oak stoves. The illustration shows our well known Home Oak stove; a very powerful heater made of No. 18 gauge cold rolled steel and finished with artistic nickelplated trimmings. It is 43 inches high, 9¾ inches round and weighs 63 pounds. $4.53 buys larger size weighing 75 lbs.

$5.87 is the price of the most popular size of the Home Oak stove. 48 inches high, 13¾ inches round, 13¾ inch firepot, weight 108 pounds. The Home Oak stoves are the best, not the cheapest, and are fully guaranteed.

$1.14 Air-tight heater made better than others on the market and cheapest at our price. We do not sell the cheapest that we can make. This air-tight heater at $1.14 is a better bargain than others at 95 cents up. It pays to buy the best.



$2.88 for an honestly made kerosene oil heater. Other styles, $3.35, $3.68, $4.80, $7.00 and $7.35. 34

Don't waste your money by purchasing a cheap stove. Get an honestly made one even if does cost a trifle more. Our stoves are all honestly made and sold at remarkably low prices. Our free stove catalogue describes our handsome base burners, also a score of other styles—all good, all low priced. You cannot afford to buy until you have heard from us. Simply write a postal card and ask for stove catalogue. We will send it promptly. Address

per cent of fat will be increased when the cow is fed a proper ration.

We should bar timothy hay from the list of feeds given and depend upon the unthreshed oats and the oat and wheat hay for roughage. The chances are, that the unthreshed oats may furnish all the grain feed required, especially if the oat grains reach 6 to 8 lbs. daily. If experience should show that the cows could profitably use more grain, feed sparingly of a mixture of bran and cotton seed meal, equal parts by weight.

He Wants the Paper Continued.

ED. HOARD'S DAIRYMAN:—I am very sorry to have caused you the trouble of reminding me of a duty to my own self which I had neglected. Indeed, you have only done what you are constantly doing: "Put us on the right track and keep us on it." Up to 3 months ago, I was merely a reading dairyman, but now I am putting into practice what I have gleaned from your valuable paper for two years while I was clerking in a Pork Factory House. Having come to live with my brother 3 months ago (he being a subscriber to HOARD'S DAIRYMAN), I didn't notice when my paper stopped coming, as I had the use of his own. Had he not received HOARD'S DAIRYMAN, I would have come to my senses pretty quick, as could not think of sitting down a minute without having the DAIRYMAN handy, but all the same I don't mean to give up my subscription on that account.

No, dear Editor, never fear of losing my subscription, for your paper is too good a guide in the dairy business to do without it. Even before I bought my herd of 15 grade Holsteins and a thorough bred Holstein-Friesian bull, I could not get along without the paper, so full of good, sound reading it was. I surely won't be without it now; your paper was the cause of my getting a first-class bull from Messrs Stevens Bros., Lacona, N. Y., an advertiser in the DAIRYMAN, and am very pleased with it.

Greene, R. I. A. F. KEEG.

DON'T PUT OFF

Seeing your friends and having them join in for a good club of subscribers.

Testing Cows with the Babcock.

ED. HOARD'S DAIRYMAN:—Since sending in my report in your issue of Oct. 23rd, of eight cows that had completed their official work for the year, another good one has come to the front. Deoines Model No. 148364 has made officially 567.71 pounds butter fat, or an equivalent of 662 pounds butter. This cow, as in fact all cows are, was tested by us personally, making 565.89 pounds, or a difference of only 1.82 pounds fat for the entire year between the test of the Experiment Station and our own test.

Our manner of making a test for the month is to take samples of four consecutive milkings, making a composite test. The Station comes and makes a one-day test each month, and it shows how accurate the Babcock test is if handled carefully. Our own tests have been made by three different persons through the year, and the Station has sent either four or five different ones, and yet we agree very closely. F. H. SCRIBNER.

Rosendale, Wis.

Does Succulent Feed Avert Milk Fever?

ED. HOARD'S DAIRYMAN:—Have dairied since I was large enough to handle a milk pail, some 40 years, and have yet to have my first case of milk fever. I fed roots up to the time the silo was adopted, and do not doubt but what the kind of feed has been my greatest safeguard against the disease.

Monmouth, Ill. BUFF JERSEY.

An Ice House without Saw Dust.

Can I build an ice house about 10 feet in ground and 10 feet above with two or three dead air spaces, that will keep ice satisfactorily without saw dust, or other material, around and over the ice? FOREST HOME FARM.

Purcellville, Va.

If your dead air spaces are tight so that there is no circulation of air, ice can be kept without saw dust.

The common ice house is usually a poorly built structure with but little attempt to make it air tight, and under these conditions sawdust is necessary.

MY PIGS AT 5 MONTHS OF AGE WEIGH 250 LBS.

International Stock Food Co., Minneapolis, Minn. DELL ROY, O., Sept. 24, 1903.

GENTLEMEN:—I am showing a herd of Berkshire nogs that I have fed **"International Stock Food"** from the time they came, and I am a winner in the show ring. I have pigs that came in April that weigh 250 lbs. each. I sold one pig just nine weeks old that weighed 86 lbs. Its mother was fed **"International Stock Food"** three times per day after the pigs were four days old. I fed her **"International Stock Food"** six weeks before she had her pigs.

I have a herd of short-horn cattle that I fed **"International Stock Food"** to all the year around, and it paid me big. I fed it to my ewes and lambs with the best results. To make a long story short, I can't nor won't be without it. I recommend **"International Stock Food"** to all breeders of fine stock. Very respectfully, CLARK GAMBLE.

☞We Have Hundreds of Thousands of Similar Testimonials and Will Pay You $1000 Cash to Prove That They Are Not Genuine and Unsolicited.☜

We own "International Stock Food Farm," which is located 12 miles from Minneapolis and contains 650 acres. We feed "International Stock Food" every day to all our WORLD CHAMPION STALLIONS, DAN PATCH 1:56¼, DIRECTUM 2:05¼ and ROY WILKES 2:06½; and also to our YOUNG STALLIONS, BROOD MARES, COLTS, WORK HORSES, CATTLE and HOGS. "INTERNATIONAL STOCK FOOD" 3 FEEDS FOR ONE CENT is Prepared from Roots, Herbs, Seeds and Barks and Won the Highest Medal at Paris Exposition in 1900 as a High-Class vegetable, medicinal preparation to be fed to stock in small amounts as an addition to the regular feed. It is a Great Aid in Growing or Fattening stock because it increases the appetite, Aids Digestion and Assimilation so that each animal obtains more nutrition from the grain eaten. We positively guarantee that its use will make you extra money over the usual Plan of Growing and Fattening stock. "International Stock Food" can be fed in safety to Horses, Cattle, Sheep, Goats, Hogs, Colts, Calves, Lambs or Pigs. It will make your Calves, Colts or Pigs grow amazingly and will keep them healthy. It is Absolutely Harmless even if taken into the Human System. You insist on eating the following medicinal ingredients with your Own food at every meal: Table Salt is a stomach tonic and worm medicine, Table Pepper is a powerful stimulating tonic, Table Mustard is a remedy for dyspepsia, Table Vinegar is a diuretic. You eat these medicinal ingredients almost with every mouthful of your food, and it is proven that these medicines promote health and strength for people and improve their digestion. "International Stock Food" contains pure vegetable medicinal ingredients that are just as safe and as necessary an addition to the regular feed of your stock if you desire to keep them in the best possible condition. "International Stock Food" is endorsed by Every High-Class Farm Paper and Over One Million Progressive Farmers and Stockmen. It purifies the blood, stimulates and permanently strengthens the entire system so that disease is prevented or cured. "International Stock Food" is sold on a "Spot Cash Guarantee" by Fifty Thousand Dealers throughout the World, and has the Largest Sale ever known. ☞Your Money will be Promptly Refunded in Any case of failure. We Refer You To Any Bank Or Wholesale House In Minneapolis. ☞Beware of the many Cheap and Inferior Imitations now on the market! HEEBNER'S "UNION" FEED AND ENSILAGE CUTTERS are the only thoroughly up-to-date machines in dry fodder cutting. They cut and crush at one operation. Prepares the nutritious lower stock, making an excellent and much relished food. No waste. Easy to masticate. It is easier to grow two tons of fodder than one ton of hay on the same ground. Fodder is equal to hay in feeding value. The corn itself is clear gain. *Shredding attachment for* $5.00. You then have cutter, crusher and shredder combined in one. Not much more expensive than other machines, but far more valuable. Send for *free* booklet

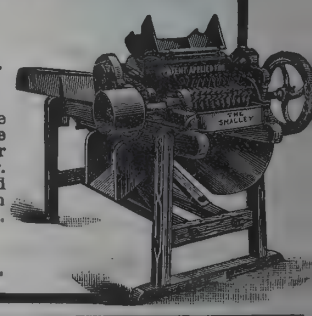
HEEBNER & SONS, 20 Broad St., Lansdale, Pa.

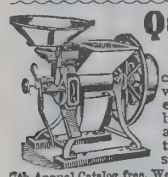
Wilder's Feed and Ensilage Cutters

and Shredders. Try one at your own place; if it does not please you better than any other machine you can buy, we stand all expense. Get our catalogue today. It contains largest line made. On the market 35 years.



Wilder-Strong Implement Co., Box 11. Monroe, Mich.

THE SMALLEY SHREDDER



HAS NO EQUAL.

It gives fodder the greatest food value, and makes it easier for the animal to masticate and digest. Requires least power; strong and durable; will outlast a dozen of the saw pattern kind. Knives adjustable to compensate for wear. We can furnish snapper rolls to remove all the ears, just the same as a husker. This combination of cutter, shredder and snapper, costs but little more than the ordinary cutter. We also make drag and circular saws, sweep and tread powers, and ensilage cutters with carriers or blowers to reach any silo. Our free catalogue tells all about our goods. Address Box No. H

SMALLEY MFG. CO., Manitowoc, Wis.

Quaker City Grinding Mills

crush and grind ear corn, mixing in as wanted all small grains, and do it faster and easier than any other. Ball bearings make light running. Make an excellent table meal. Time given to prove these things. If you are not satisfied return and we pay charges.

17th Annual Catalog free. We sell gas and gasoline engines and other powers.

THE TUBULAR

Makes Dairy Work Light — **Makes Dairy Work Neat**

Two big advantages about the Tubular Separator—aside from the greater profits resulting from its use—are lessened labor and increased neatness. Remember that pans, crocks, and complicated bucket-bowl separators are hard to wash—and you'll remember that you want something simpler. Remember how sloppy high supply cans are—how annoying oily oil cups are—and you'll remember that you want something neater.

It Practices What We Preach

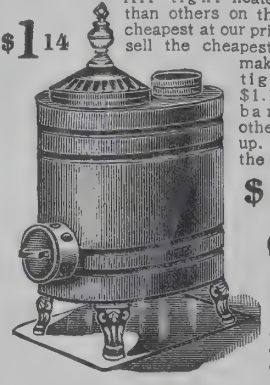
It's easy to wash a simple Tubular Separator bowl. It has no complicated parts—no discs—vanes—or cones—no graters to scrape the fingers. Think how low the door knob is and you've thought about how low the supply can of the Tubular is. To think **how low** is to think **how easy to fill.** You remember the Tubular has no oil cups—that all gears are covered, and run in a mist of oil. It fills your demands and our guarantee.

If you haven't one of our handsome catalogues, wouldn't you like one? It's free—just ask or write for it.

The Sharples Co., CHICAGO, ILL. — **P. M. Sharples,** WEST CHESTER, PA.

Simply Send a Postal

and ask us to mail you our new illustrated stove catalogue, and we will forward postpaid our complete catalogue of stoves and ranges, which illustrates and describes everything in the stove line for cooking and heating worthy of your consideration—all at prices decidedly low. We sell only the best grades, avoiding the very cheapest. If you want an honestly made stove you cannot afford to place your order until you have seen our stove catalogue. A postal card will bring it.



$4.00 as here illustrated.

$3.20 is our price for a good stove with a 9¾-inch firepot. It is a much better stove than some firms sell at a higher price, but if you want the best send for our stove catalogue and read about our famous Home Oak stoves. The illustration shows our well known Home Oak stove; a very powerful heater made of No. 18 gauge cold rolled steel and finished with artistic nickelplated trimmings. It is 43 inches high, 9¾ inches round and weighs 63 pounds. $4.53 buys larger size weighing 75 lbs.

$5.87 is the price of the most popular size of the Home Oak stove. 48 inches high, 13⅛ inches round, 13¾ inch firepot, weight 108 pounds. The Home Oak stoves are the best, not the cheapest, and are fully guaranteed.

$1.14 Air-tight heater made better than others on the market and cheapest at our price. We do not sell the cheapest that we can make. This air-tight heater at $1.14 is a better bargain than others at 95 cents up. It pays to buy the best.

$2.88 for an honestly made kerosene oil heater. Other styles, $3.35, $3.68, $4.80, $7.00 and $7.35.

Don't waste your money by purchasing a cheap stove. Get an honestly made one even if does cost a trifle more. Our stoves are all honestly made and sold at remarkably low prices. Our free stove catalogue describes our handsome base burners, also a score of other styles—all good, all low priced. You cannot afford to buy until you have heard from us. Simply write a postal card and ask for stove catalogue. We will send it promptly. Address

A Connecticut Ration.

Would you kindly formulate a balanced ration for grade Jersey and Ayrshire cows with different milk yields and weighing from 700 to 900 lbs. For roughage I have corn stalks (Dent variety cut when corn commenced to glaze) well eared and under cover; look bright and nice. Dry brewers grains, $17.00 per ton; gluten (Buffalo) and (Glen cove) $25.50; oil meal, $29.00; cotton seed meal, $29.00; bran, $22.00; wheat feed or middlings, $23.00; oats, $1.20 per bag, 10c per bag for grinding. Kindly state how many pounds of the grain ration should be given cows giving say from 10 to 20 lbs. milk per day, 20 to 25 lbs., 25 to 30 lbs., 30 to 35 lbs., 35 to 40 lbs.? Roughage I suppose will be the same for all. SUBSCRIBER.
Norwalk, Conn.

We should consider the following a good average ration:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
25 lbs. corn stover	14 90	.43	8.10	.18
6 lbs. dried grain	5.51	.94	2.18	.31
2 lbs. oil meal	1.82	.59	.65	.14
Totals	22 23	2.06	10.93	.63

We should want the cows to eat fully 25 lbs. of the stover, and this will necessitate feeding considerably more than that amount, as there will be quite a percentage of the butts of the coarser stalks that they cannot masticate. There would be a considerable saving if these stalks could be put through a cutting box, enough to last 10 days or more, dampened and put in a compact pile, where they will heat and soften.

Theoretically, a ration as above should suffice for a cow giving 27 lbs. of milk, daily, containing one and one-third lbs. butter fat. For every 10 lbs. increase or decrease in milk, increase or decrease the digestible protein one half-pound, but do not make such a rule as this too rigid. Watch carefully for results, and let them be the guide. We think that with only corn stover for roughage some grain should be fed even to dry cows.

A Test for Cotton Seed Meal.

The Vermont Experiment Station gives the following test which any farmer can supply himself. Place a teaspoonful of the meal, do not use more, in a tumbler and pour over it an ounce and a half to two ounces of water. Stir the mass until it is thoroughly wet up and all the particles are floating. Allow it to subside for from five to ten seconds and pour off. If a large amount of fine dark brown sediment has settled in this time, a sediment noticeably heavier than the fine mustard yellow meal, one which upon repeated treatments with boiling hot water keeps settling out, the goods are a feed meal; i. e., meal containing relatively large quantities of ground hulls. If, however, there is found a larger amount of this residue, one which persists in remaining after several washings, it is surely composed of hulls and it is a feed meal or an adulterated cotton seed meal. The results are striking when the same sample is compared with a pure cotton seed meal.

DON'T PUT OFF

Seeing your friends and having them join in for a good club of subscribers.

For shaving Ivory Soap is preferred by many. Its lather is profuse. Hot water instantly softens the surface but does not melt the cake to waste in the cup. Ivory Soap is aseptic and odorless and rinses away entirely, leaving the face smooth and absolutely clean. It costs about one-fifth as much as most of the so-called shaving soaps.

Ivory Soap—99 44/100 Per Cent. Pure.

THE BEST THROUGHOUT MAKES ELMCO FEEDS SUPERIOR

Hard Spring Wheat, the strongest and best for flour or feed in America, and that means the best in the world, is used exclusively in ELMCO Feeds. But not ALL of even this wheat is used, only that which comes up to our high standard of quality.

All the wheat we use is carefully inspected by an expert Grain Inspector, member of the Minnesota Bureau of Grain Inspection, who is permanently located at our mill. The maturity of the wheat, the quantity and quality of protein and other essential points which go to make up the difference between the best grades and inferior grades of wheat, are carefully investigated.

A successful quarter of a century in the milling business is our experience record. Our trade in that time has grown from a small local patronage to one that is world wide in scope. Our mill is the largest in the country outside of the Minneapolis and Duluth combinations, the cleanest and best equipped barring none.

We are offering you superior feed at practically the same price you are paying for inferior. Ask us for samples and prices, your Banker as to our reliability.

The Bang System for Stamping Out Tuberculosis in Cattle.

At the annual meeting of the American Association of Veterinary Science, held at Ottawa early in September, a valuable paper was read by the Hon. Senator Edwards giving his experience with the Bang system for the eradication of tuberculosis as practiced at his farm at Rockland, Ont.

"Coming to the subject on which I am to occupy your time for a few moments and referring to a remark made in a former sentence of this paper, viz,. the close alliance and association between human beings and domestic animals, and recalling a statement made by the great German scientist, Dr. Koch, about two years ago, the question of tuberculosis in our domestic animals would appear not to have the same significance as affecting human beings as was fomerly generally supposed. The relation or similarity as between human and bovine tuberculosis and the communicability from one to the other is, however, one for scientific and professional men to thresh out. I will not presume to express any opinion on this complex question. I will be permitted, however, I am sure, to say that for myself, I regard the safest course, while doubt still remains, is to allow the doubt to rest on the side of the greater security and continue to assume that there is danger until it is uncontrovertibly proven that there is no danger of human beings contracting tuberculosis in various ways from domestic animals so diseased. But even if finally it is proven that the disease is not communicable from animal to man, there is no reason why the efforts being made for the eradication of the disease in our animals should be stayed for a moment. In our best interests, having regard to the animals only, it is most highly desirable that the disease should be eradicated. It is to be found to the greatest extent in our pure-bred herds, the source from whence sires are obtained for the general improvement of the herds the world over, and unless our pure-bred herds are cleansed of the disease, the process of spreading it will go on until it pervades the entire live stock interests of each country where it is not eradicated, and the extent to which it will be injurious to the live stock of each country will be measured by surrounding conditions, and the loss of animals will be measured largely by the general sanitary or unsanitary and other conditions prevailing, so that regardless of the matter of the danger to human life, it is highly in the best interests of the stockmen that his herds and flocks should be free from disease of every nature.

The question arises — can tuberculosis, one of the most constant diseases present in animals, be eradicated? My answer is, "YES," most emphatically. It can be done, and once eradicated, by reasonable care healthy herds and flocks in this respect can be maintained; and the system we recommend is the Bang system which has been rigidly practiced on our farm since the year 1898. In the spring of that year, intending to ship some young bulls to Wisconsin, we asked our Dominion veterinary authorities to test them, and to our surprise and regret it was found that all responded to the tuberculin test. This was our first knowledge of the existence of the disease in our herd. For a few days we were undecided what course to pursue, but on consultation with Hon. Sydney Fisher, Minister of Agriculture, who recommended testing the whole herd, and who further urged upon me the advisability of adopting the Bang system for the eradication of the disease, and on our consenting, he at once placed us in communication with Dr. McEachern, then Chief Dominion Veterinary Inspector, who immediately had the entire herd tested and gave us full information and instructions as to the Bang system. The greater part of the herd responded to the test and a separation was at once made of the healthy from the diseased animals. The decision was to weed out and kill all but animals of desirable pedigree and individuality, and the slaughtering took place under veterinary inspection. Of the 50 to 60 animals slaughtered, only three proved unfit for human food, but in all, traces of the disease in a more or less degree were found, but in most cases, very trifling traces of it. The stables formerly occupied by the herd were most thoroughly disinfected for the reception of the healthy animals and entirely new premises were erected for the diseased animals we retained in our herd, and in like manner the diseased animals have been kept in separate and distinct pastures from the healthy ones since that time and have never mingled in any way.

RAISING THE CALVES.

In the inception of our experiments, we sterilized the milk from the diseased cows as directed by Dr. McEachern, and fed the calves from the pail. This plan we found successful in so far as raising sound calves was concerned, but it is a somewhat troublesome one, and further, we lost a few calves as we believe from the fact that they were so fed at once without first taking the mother's milk in the natural way. This plan, while successful, we have discarded entirely, and we have adopted the plan of raising the calves on nurse cows, allowing the calf always to suck the mother once before making the change. This plan we have found most successful in every particular, and in the practice of either of these plans described, we can vouch for it from our experience that healthy calves can be most successfully raised from diseased dams, or diseased sires and dams, and if all is carefully carried out, the percentage of diseased calves raised will be very small indeed, so small that it need hardly be considered. In our experiments everything has been entirely satisfactory to us, and we strongly recommend the practice to our brother breeders, many of whom we are sorry to say have, up to this time, resisted the advice in this respect of our veterinary authorities, both in the United States and Canada, and the subject has been a most controversial one. We can only say for our part that after a very considerable experience we are firm believers in the Bang system, and we are believers in the tuberculin test as the only present means, so far as we are aware, of ascertaining the existence of the disease. The only failure, so far as we have knowledge of, is in cases where the disease is in such an advanced stage that reaction does not take place. In a well conducted herd such cases will be few and far between.

Further, we have experienced none of the unfavorable results that are put up by those opposing the test. In no case have we known, in the many hundreds of animals we have had tested, of an injury to the animal; neither have we experienced any trouble in abortion in cows tested and we have had them tested at all stages of pregnancy.

We are firm believers in the tuberculin test, as we have described, and we are also firm believers in the Bang system, and until these are improved upon—if they can be improved upon—we shall practice both in the management of our herd. No matter what the practice and requirements of our government authorities may be, we on our part shall not relax our efforts in the direction I have stated until all our herds are absolutely free from disease, and until better means are known, we shall always use the tuberculine test to ascertain the conditions of the health of our herds.

EDUCATION AND UNITED EFFORT NEEDED.

Having given our practice on the farm, I may now be permitted, perhaps, to make a few general remarks. The discovery of the extent of the disease in the herds of various countries a few years ago caused such a commotion that most rigid enactments were passed by several legislative bodies; extreme conditions were imposed, doing, unfortunately, in our opinion, a great deal of harm, arousing the antagonism of breeders and stockmen. Much of this legislation has been rescinded and more reasonable measures are now adopted, as a result of a greater knowledge of the subject. Mistakes, if there have been mistakes, were not wilful but well intended on the part of the authorities of each country, but we submit that if the disease is to be eradicated from any country it must be through a campaign of education and united effort on the part of the breeders of the country. The exclusion of importations will never help to eradicate the disease just so long as the disease exists in the herds of the importing countries and our veterinary authorities will do well to show the simplicity with which the disease may be eradicated, rather than impose unnecessary conditions.

Apart from the test and the application of the Bang system, cleanly and sanitary conditions, good ventilation and plenty of sunlight, and as much outdoor life as possible are the requisites. To the beginner in stock breeding we would advise great care in seeing to it that he begins his operations with animals free from disease, and that he attends well to his ventilation and sanitary conditions, and if at any time he buys to strengthen his herd to see to it to a certainty that he does not buy disease with the animal.

To the breeder, small or large, who discovers the disease to exist generally in his herd, if the animals are of inferior pedigree and individuality, we recommend turning off to a butcher, to be killed under veterinary inspection, all animals that respond to the test, and begin anew, but in no case would we recommend the slaughtering of valuable animals where they are still in good breeding form and vigorous appearance, but we advise the system of separation we have described in this paper. The same full measure of separation may not always be possible, but the best that can be done should be done in each instance and under no circumstances neglect the matters of ventilation, good sanitary conditions, plenty of sunlight, and as much open air life as possible. I am fully convinced of the reasonable possibility of the eradication of tuberculosis from our herds and of the maintenance of sound herds, and my earnest hope is that our breeders may at no distant day be so educated in the direction I have endeavored to describe that they will put into practice the only present known means of ridding their herds of a disease which in the past has been so destructive in its consequences.

GUERNSEY BULL, SHYLOCK OF DARLINGTON, A. G. C. C., 4579.
Property of KANSAS EXPERIMENT STATION.

GUERNSEY BULL GLADYS JOHN, A. G. C. C., 6979.
Property of C. J. HAESE, Collins, Wis.

Kansas Experiment Station Guernsey Bull.

ED. HOARD'S DAIRYMAN:—We send you a photograph of our Guernsey bull, Shylock of Darlington 4579. We consider this bull a very fine specimen of his breed. His dam, Nubia's Vesta produced 556 pounds of butter in six months.

Mr. J. F. Schlappi, who was superin-

tendent of the feeding department of the Pan American Dairy Test, while in attendance at the Kansas State Dairy Association, scored this bull before the class and gave him 98 points out of a possible 100. Mr. Schlappi said: "I would not want an animal of better shape and it would be hard to find an animal with any better skin and hair than this bull has. I think this animal is a very fine one and good enough for any man's herd. The College ought to be congratulated on having such a fine animal."

Alfalfa—Hay Caps.—Box Stalls—Queries from New York.

ED. HOARD'S DAIRYMAN:—I have an acre field of alfalfa which was sowed this spring, used 20 pounds of seed with 1½ bushels of oats as a nurse crop. The land was well prepared and enriched by some 12 loads of manure, and 500 pounds of phosphate. The oats were cut for hay when well headed out, the alfalfa plants bring very small at this time, but have grown considerable since and now stand from 8 to 12 inches high; did not cut it this fall, thought it would not grow enough afterwards to protect the roots this winter.

Should I get some soil from some old alfalfa field to inoculate this piece with, and if so, how much? There are no alfalfa fields nearer than 150 or 200 miles that I know of. Don't seem to me the plants are as vigorous as they ought to be, but this may have been caused by the drouth last spring. I am intending to sow 4 acres more next spring. Would you advise plowing a piece of land on which potatoes were raised this year, or simply go over it with a wheel harrow a number of times next spring.

I have a cow stable which is arranged as per diagram inclosed and I would like to know if you consider it advisable to add on some 14 feet in behind the stable and also behind the silo, so as to give me room for a box stall, for cows coming in and for young calves. The only objection I see is that one cannot get any sunlight, only a while in the afternoon, but there is no other place in which I can add it, and have either to add on behind, or build a little separate building nearby.

Where can one buy cotton hay caps which you speak of buying for 12 cents each? I consider HOARD'S DAIRYMAN the best paper for a dairyman, published in the United States. H. P. P.

North Bangor, N. Y.

If the alfalfa is on land which has hitherto borne good crops of common red clover, or if clover does well in that neighborhood, we should attribute the backward state of the field seeded last spring to the drouth. In the matter of infecting the soil with the special alfalfa bacteria we hope the Department of Agriculture at Washington will be able, before next spring, to supply all demands.

It would probably be quite as well to plow the land this fall for next spring's seeding, but this is not indispensable. The more important matter is to prepare a fine seed bed next spring. Work the ground over and over until every lump is pulverized and there is a fine tilth, full three inches deep.

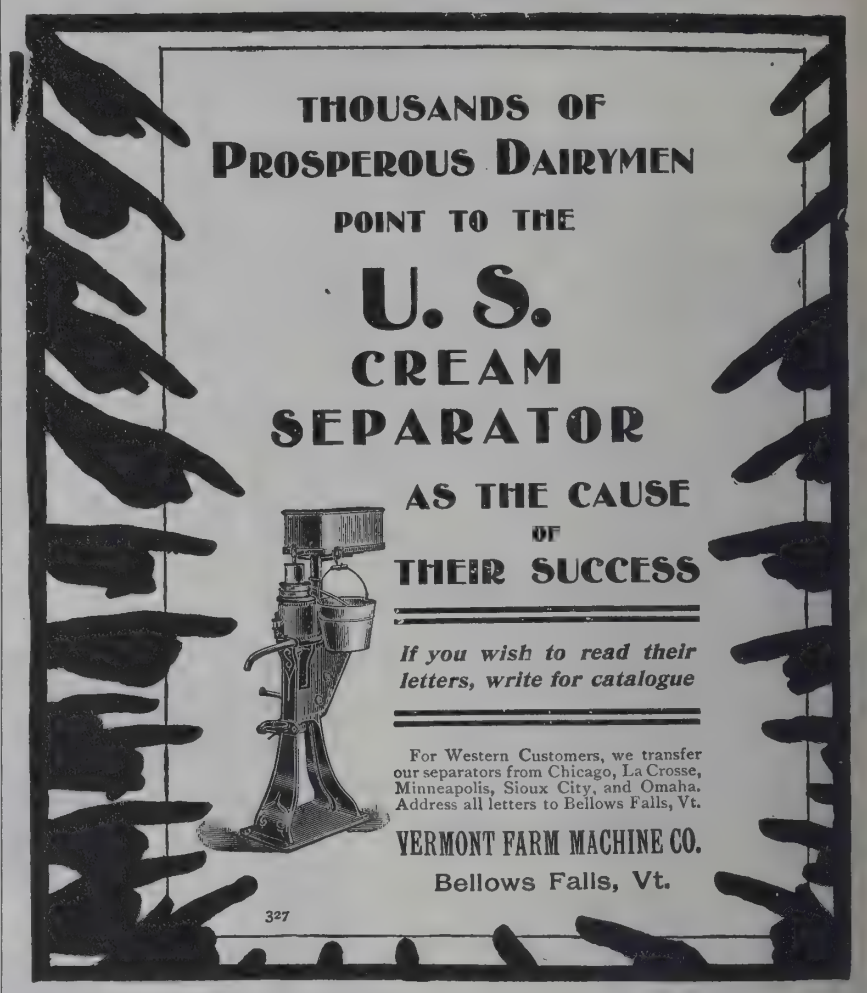
The cotton hay caps are bought in any dry goods store by simply getting a fair article of common sheeting, 40 to 45 inches wide, and tearing it into squares and attaching a light weight—the half of a common horse shoe answers a good purpose—to each corner.

The proposed location of the building for a box stall will be better, all things considered, than a separate building. Give it as much light as practicable.

Creamery Situation in New York.

ED. HOARD'S DAIRYMAN:—The fall of 1903 has noted some interesting features in connection with the eastern creamery situation. Important changes have been made in some of the largest concerns and the future course of these corporations is a matter of some speculation among patrons and others. Meanwhile the Borden people keep calmly along and appear to be the controling force of the future.

The Franklin County Creamery Association, of Vermont, the Cannajoharie Creamery Company and the Bainbridge Creamery Company of New York, together with a few other smaller plants in the country, and some extensive distributing stations in New York city, are now understood to be under one corporation, the Creamery Products Company.



It is said that Mr. Walter Lipe, president and manager of the Cannajoharie Creamery Company for some years, is president of the Creamery Products Co., to succeed Ex-Gov. Smith of Vermont. He will continue as Supt. at Cannajoharie, and has also taken a similar position at Bainbridge, dividing the most of his time between the two plants. Mr. Geo. B. Clafflin has been appointed Supt. of the Franklin County Creamery at St. Albans, Vt., to succeed Mr. T. M. Deal, who has recently resigned, after several years labor there, he having built up the largest single concern in the east, and one that for some time was considered the largest butter making plant in the world.

Mr. W. W. Hovey who resigned the position of manager at Bainbridge, to accept a similar position with the Standard Creamery Co. at Cooperstown, was with the Bainbridge concern nearly two years. He is the son of C. C. Hovey, the founder of the Bainbridge creamery. Mr. C. C. Hovey sold out to the Casein Company of America, and they in turn parted with the title at a good profit. At present the Casein Company are not supposed to hold much of the stock of the creamery company.

Mr. Oakley T. Thorn is said to be managing the financial end of the new concern, while Mr. Walter Lipe looks after the creameries. It is a gigantic concern and well calculated to test the practicability of a large creamery enterprise. It is claimed that prices paid for milk will not be cut, though it is acknowledged that directors are looking for larger returns on their investments than they have been receiving of late.

The Bordens are not far away, though they have no plants in the immediate vicinity of any of these creameries. As regards Bainbridge, there can be no doubt but that the Bordens have, for several years, exercised a greater influence in fixing prices than any other factory. They have no plant in the Susquehanna valley, but the Chenango valley, which joins the Susquehanna thirty-five miles below, is practically controlled by them. Their prices are the criterion for all creameries for a large range of territory.

The Susquehanna valley is a good dairy section, and it would not be sur-

WHEN YOU SEND IN YOUR RENEWAL, SPEAK TO A FEW OF YOUR NEIGHBORS AND HAVE THEM JOIN YOU. CLUB RATES: 2 Subscriptions, $1.50; 3 Subscriptions, $2.00; 4 Subscriptions $2.50 5 Subscriptions, $3.00.

prising if, some day, the Bordens should enter it. They are to all appearances the great "milk trust," if there is one, of the east. Neither the Milk Exchange, the Pure Milk Company, nor the Creamery Products Co., can compare with them at present.

At the Bainbridge plant many of the old force are retained. Mr. Geo. G. Wiley, who has been assistant in the office for a year or more, is to be assistant manager, it is said, and Mr. Frank Redfield, who has been foreman for a number of years, now has the title of Supt. of the raw products department. Mr. Searles, of the office force, is now head bookkeeper in place of Mr. B. M. Stannard, who has resigned.

Chenango Co., N. Y. H. H. LYON.

Program Missouri State Dairy Association.

FIRST SESSION, TUESDAY, DECEMBER 8, 7:30 P. M

Music - - - - Orchestra.
Address of Welcome for Clinton - - - - - - - - Mayor Armstrong
Response on behalf Association - - - - - - J. L. Erwin, Steedman
Music
President's Address - - - - - W. W. Marple, St. Joseph
Appointment of Committees.
Announcements.
Social Hour.

WEDNESDAY, DECEMBER 9, 9:30 A. M.

My Experience With the Silo. - - - - - John Patterson, Kirkville
Discussion by Joseph Elliot, Windsor, H. F. Hand, Taberville, and others.
Home Grown Balanced Rations - - - - - W. M. Love, Osceola
Discussion by E. Gauss, Columbia, H. T. Burris, Clinton, J. P. Rust, Peculiar
The Cow for the Missouri Dairyman and How to Get Her, - M. E. Moore, Cameron

Missouri Dairy Products at the World's Fair - - - - - - - W. W. Marple
(Superintendent Dairy Exhibit, Missouri World's Fair Commission, President State Dairy Association.)

The income from the average Missouri milch cow is $30 per year. The cows belonging to members of the Dairy Association average over $60 income per year. Come and learn how it is done and tell how you do it.

The average farm-made butter in Missouri sells for 15 cents, but the best dairymen average 25 cents. In which class do you belong?

Come and see the best butter made in the state, see the best up-to-date dairy machinery; come and get acquainted with the successful dairymen from all over the state.

One and one-third rates on all railroads; $250 in prizes for butter and cheese. Exhibit of best dairy machinery. Dairy cow contest, two prizes. Butter making contest, two prizes.

"ADVERTISEMENT."

BOTH FEEL

What Proper Food Does for Both Mind and Body.

Physical health, mental health, indeed almost everything good on this earth depend in great measure upon proper food.

Without health nothing is worth while and health can be won almost every time by proper feeding on the scientific food Grape-Nuts.

A California trained nurse proved this: "Three years ago I was taken very sick, my work as a trained nurse having worn me out both in body and mind, and medicine failed to relieve me at all. After seeing a number of physicians and specialists and getting no relief I was very much discouraged and felt that I would die of general nervous and physical collapse.

"My condition was so bad I never imagined food would help me but on the advice of a friend I tried Grape-Nuts. The first package brought me so much relief that I quit the medicine and used Grape-Nuts steadily three times a day. The result was that within six months I had so completely regained my strength and health that I was back nursing again and I feel the improvement in my brain power just as plainly as I do in physical strength.

"After my own wonderful experience with Grape-Nuts I have recommended it to my patients with splendid success and it has worked wonders in the cases of many invalids whom I have attended professionally." Name given by Postum Co., Battle Creek, Mich.

Look in each package for a copy of the famous little book, "The Road to Wellville."

EMPIRE

There is no royal road to success, but there are roads which are harder than others. There is no way to make money out of dairying without work, but there are ways easier than others. The EMPIRE way is the easy way. It is the way to make the most profit with the least labor and the least expense. It is the most satisfactory way. The EMPIRE Cream Separator is the easy machine to operate and the most profitable machine to use. It is easy to buy because the increased profits pay for it. It is easy to operate because of its simple construction. Our book tells about the EMPIRE way of dairying and about the EMPIRE Cream Separator. It is free for the asking.

Empire Cream Separator Company,

Main Office **Bloomfield, N. J.**

Western Office **Chicago, Ills.**

Cream Separator Talk

can be made strongly persuasive, but it's only talk after all. The Thing that satisfies is trying at your home. The

AMERICAN

is sold on trial. It's the separator that makes its own way. No obligations to buy it if you shouldn't be pleased. The price is right. If you want to try it with a view to buying, say so. The catalogue is mailed free. Write for it.

WILL IT PAY YOU TO TAKE HOARD'S DAIRYMAN?

W. H. Jenkins took a census in 1901 of 50 farmers who were patrons of the creamery in Montrose, Pa. Twenty-five of them read dairy papers; twenty-five did not. The twenty-five who did read dairy papers averaged $50.23 per cow for the year. The twenty-five who did not read averaged $32.95. Here is a difference of $17.28 per cow. Did it pay the twenty-five to read? Did it pay the other twenty-five not to read? That's not all. Those who did read averaged a profit over cost of food of $15.06 per cow. Those who did not read averaged a profit of 66 cents. Is not that dairy farmer standing greatly in his own light who will not pay 2 cents a week for Hoard's Dairyman? These are hard facts worth thinking over.

GATHERED CREAM FROM FARM SEPARATORS AND THE PASTEURIZER.

It is quite evident that the coming evolution of creamery practice is irresistibly toward the separation of cream on the farm by the use of the farm separator, and the gathering of the same by teams. The compelling cause of this change is the saving of labor and cost in the transportation from the farm to the creamery, and the very greatly increased feeding value of the skim milk. The real foundation of the creamery rests in so conducting the business that the farmer shall get out of it all the value there is in it for him. Certain creamerymen seem to think that they should take the first and largest profit and what is left may go to the farmer. But any creamery enterprise conducted on this basis is sure to be short lived, and the capital invested in it is soon put out of commission. It is for this reason that we believe that the farm separator has come to stay, and all future evolution will be in that direction. If this system is adopted, two things become necessary at once, if the butter to be made is of first-class quality.

1. Systematic effort must be put forth on the part of the creamery to educate the cream producer how to care for his cream in a manner that will result in making the best butter possible. Every creamery has it within its power to push such a system of education. All that is necessary is a good understanding, on the part of the butter maker, of the farm and stable conditions of each of his patrons, and good tact, patience and untiring purpose. Before such qualities, the most stubborn ignorance will soon give away.

2. In every gathered cream creamery, the pasteurizer becomes an indispensable part of the machinery. This fact is almost universally recognized in Denmark, the most efficiently organized dairy country in the world.

Instead of blindly fighting the inevitable advent of the farm separator, as some American creamery people are doing, it would be much more sagacious on their part to clear out the difficulties that lie in the road, and do all that is demanded on their part to make it a success,.

The two lines of procedure that we have indicated, will, we believe, end in widely increasing the number of farmers who will become creamery patrons and also greatly improve the butter product.

THE REASON WHY.

There is a large class of dairymen who are very much dissatisfied with the results of the business. We lately sent out 12,000 letters with a stamped, return envelope, to old subscribers who in the past three years had failed to renew their subscription. We requested from them a frank, free statement why they had discontinued reading the DAIRYMAN, and if it was because of any fault on the part of the paper. Fully three-fourths of these people have paid us the especial favor of answering our letter. A large number of them subscribed for the paper again, stating that their failure to renew was mainly through inadvertence or neglect. But fully 75 per cent of those who did not renew, stated that they thoroughly enjoyed and appreciated the paper, but they had become dissatisfied and discouraged with the business from one cause or another, and had gone out of it.

The reasons these men give for their dissatisfaction constitute very instructive reading. It is a look behind the scenes. There are two reasons given that are largely in the majority. These are (1) lack of good, efficient help, and (2) the low profit they get from their cows.

The first is a condition that will require especial effort and enterprise to correct. There is no reason why dairy farmers should not break into the labor market with the same wide awake effort that manufacturers use. Anyway, staying on the farm and waiting for the hired man to present himself has not relieved the tension very much.

But this question of a larger revenue from the cow, seems to be, with a large portion of our correspondents, a most serious stumbling block. The statements they make disclose, in a great many instances, that they are trying to measure the necessities of today with the ideas and standards of fifty years ago. And they honestly wonder that they cannot secure a better fit. We cannot wonder that cows do not pay in so many instances when we note the ideas farmers have about what sort of a cow they want; what sort of a bull they want for her sire; what kind of treatment they will accord her; how they will feed her and care for her.

There seems to be a tremendous lack of real, earnest, studious determination to solve this cow question on right lines. The curse of this dual-purpose idea stands square across the way of breeding better cows. Bulls are selected that have not an ounce of dairy prepotency in them. Somebody tells the farmer that this beef bred bull is of "a milking strain," and that is enough. As well think of breeding trotting horses from two-thousand pound draft stallions if only some one would say they are from "a trotting strain." All these things fall on listless ears. The farmer grinds away with his beef bred cows from a bull still more beefy—from a milking strain—and finds himself ground to powder between the upper and lower millstones. It was for the purpose of opening the eyes of these farmers that we instituted the taking of "Cow Censuses" in various states. HOARD'S DAIRYMAN has piled up the evidence mountain high, that it does pay to have dairy ideas about breeding, feeding and caring for dairy cows. We have shown that hundreds and thousands of men do make cows pay; do get a handsome return from their cows. But in every instance, nearly, such men are doing business with dairy cows and are governed by dairy ideas.

We have shown scores of herds sending milk to the same creamery, where one man with the *right kind of cows* would receive from $1.50 to $2.00 for every dollar spent in feed, and another, because he would not be governed by dairy ideas, was sustaining a loss on every dollar spent in feed. And still the plaint goes up; "I can't make any money with cows," and because this is true, whether it ought to be true, or need to be true, farmers are going out of dairying.

It is a hard struggle, this getting men to acknowledge the truth that is before their own eyes, when their whole life training has been in a contrary direction.

The main hope the country has for a successful class of dairy farmers lies in the young men who have the brain to see and the heart to take hold of the proposition of making true dairymen of themselves.

The twelve thousand letters have proven a "flood of testimony," showing how good men have struggled against a lack of dairy understanding, and could not see that there lay the cause of their defeat. It is so hard for poor human nature to say: "I don't know enough," or "I am wrong." Yet it means that where one man with right ideas succeeds, others with wrong ideas fail.

A GREAT WASTE OF CORN FODDER.

The greatest accomplishment in the way of agricultural progress in the past quarter of a century has been in causing the farmers of the United States to see how wasteful some of their previous ideas and methods had been. Philip Armour, the great Chicago pork packer, once said to the writer:

"The finest brain, the most exhaustive purpose, and the largest employment of capital in this whole establishment is devoted to the prevention of waste."

It was Mr. Armour's boast that he "had utilized everything in a pig but his squeal." He considered it the chief glory of his great fortune to do just that thing.

What a contrast in ideas and things valued, was this man Armour and the farmer from whom he bought his hogs. They fattened hogs for him and dire waste marked every step of the pig's life, until he reached Armour. Most of the pig-raising farmers in the West fatten their hogs and cattle on corn, yet scarcely a thought is given to the question of thorough economy in utilizing the whole plant, stalk as well as ear. If Armour had thrown away 40 per cent of the hog after he had bought him, he would have been in a parallel state with the farmer who raises a hill of corn and pays little or no attention to the value of the stalk.

George B. Ellis, Secretary of the Missouri State Board of Agriculture, has recently called the attention of the farmers of his state to their almost criminal waste of corn stalks. He recounts the following experiment in Missouri to demonstrate the value of good corn stalks as compared with timothy. The experiment was conducted as follows, with good, grade yearling Hereford and Short-horn steers. The trial lasted from December 1 to April 1:

"In no case was any grain of any kind fed. The steers had access to an open shed, under which the feeding was done. A careful record was kept of the amount of feed offered, the amount refused, and eaten, and the gain or loss of live weight.

"The fodder had been cut and cured in the usual way, and allowed to stand in the field in shocks, sixteen hills square, and was hauled as required for feeding. The shredded fodder was exactly like the whole fodder, ricked and topped out with hay or straw. The silo fodder was harvested at the same time as the others, cut into half-inch lengths and stored in a silo until wanted for feeding. These fodders were from alternate rows in the same field, cut at precisely the same time, and in all cases the ears were removed before being cut. The hay was as pure timothy as could be had on the state farm, cut when the seeds were in the dough, cured in the usual way, and stacked in the field until required for feeding. It was our aim to compare the feeds under precisely the conditions the ordinary farm affords:

BIG GAINS MADE.

The results showed especially large gains in weight from shredded corn fodder. The test proved conclusively that farmers are losing big money by wasting this product.

There is not a corn state in America that is not out several million dollars annually through the neglect of this material. In Missouri, this year, at a low estimate, there are nearly seven million acres of corn. It is distressing to contemplate that 30 per cent of the total value of this crop will be wasted through the neglect of the fodder.

"As soon as the farmers learn to follow the example of business men, their waste will stop. A successful factory, packing-house or the like, wastes nothing. Some use is made of all material. If the farmers will only learn to give attention to small details, as do the business men, their profits will increase at a surprising rate."

It Was a Joke.

Surely the authors of Wisconsin Station bulletin No. 102 have perpetrated a joke on Governor Hoard. They say he selected a grade Jersey cow for the University, "to represent his type of a dairy cow for students and economical work in the dairy." Then they say: "The only criticism offered on her is her lack of substance or vitality, and a lack of capacity for feed and work." Is that all? She's like the old negro's horse; "A mighty good hoss, only one of his laigs is cut off." *Jersey Bulletin.*

"*Is that all?*" What more could anybody ask by way of humorous criticism from a Professor of Animal Husbandry in an Agritural College? You wouldn't expect him to be a Bill Nye, or a Mark Twain, would you?

Of course that cow was not the best one in the herd, or the poorest one, so there were limits even to facetiousness. But despite her lack of substance (her weight was 797 lbs.), and incapacity for feed and work, she was made to consume $35.51 worth of feed annually for three years, and gave in return a yearly average of 363 lbs. of butter and net profit of $44.03. Whether her subsequent death from septic bronchitis was due to "lack of vitality" or lack of proper care may never be known.

City Milk Supply.

Excerpt from Bulletin 92, Illinois Experiment Station.

Owing to the many evils resulting from the use of impure milk, special interest has recently been taken in the quality of milk furnished in our cities. On account of this interest Wilber J. Fraser, Chief in the Department of Dairy Husbandry at the Agricultural Experiment Station, has prepared Bulletin No. 92 on "City Milk Supply," which is now in the hands of the printer. This bulletin treats of the need and the value of high grade milk for direct consumption and the methods that should be used in its production.

The following is an abstract of this bulletin:

The consumer is especially interested in five things in connection with his milk

supply and for these the producer should be responsible:

First, that the milk furnished him have a certain known composition which is uniform from day to day.

Second, that the milk keep a reasonable length of time, at least twenty-four hours, after being delivered, if kept at a temperature of 60 degrees or below.

Third, that the flavor of the milk be not injured by improper feeding, careless methods in handling the milk, or by the development of certain species of bacteria in the milk which cause bad flavors.

Fourth, that the milk be not injurious to health; that is, that it contain no disease-producing germs, or any form of preservative.

Fifth, that the milk be clean.

The consumer has the right to demand information on the above, and unless such information be furnished should refuse to take the milk. The public has long been defrauded by dishonest and unscrupulous milk dealers and the honest dealers have been, and are still having a hard fight with dishonest competition.

The most effective remedy for this difficulty is for the public to patronize only those who furnish a good grade of milk and are willing to guarantee it.

COMMON METHODS ARE FAULTY.

The evils resulting from the use of impure milk are so numerous and the methods commonly employed in its production so faulty, that everyone interested in the public welfare should be anxious to assist in bringing about an improvement. Some of the reasous for this may be briefly stated as follows:

No other article of food is so generally used by all classes of people.

No article of food is more healthfnl and economical than milk when pure, and none is more dangerous to health when carelessly handled.

Much of the milk for direct consumption is used in its raw state.

Since the invention of the Babcock test and the cream separator, every dairyman can easily standardize the milk and cream he sells.

Milk being an opaque liquid, its quality and cleanly condition cannot be easily detected by its appearance.

Milk is an ideal medium for the growth of germs; because of this it is especially important that it be handled with the greatest care and that no disease germs be allowed to gain access to it.

Many infants and invalids subsist almost, if not entirely, upon milk and it is of vital importance that milk for such persons be as pure and free from bacteria as possible.

To secure desired results care must be exercised in every step of milk production and delivery. There is no use in observing all but one of the precautions necessary for the production of high grade milk, as this one neglect spoils the whole.

It is true that it costs more to produce milk under good conditions than in the ordinary, slovenly manner, but when the public becomes educated up to the advantages of such milk they will be willing to pay the extra cost of producing. However this extra cost is but slight and even then leaves four per cent milk at seven cents a quart, cheaper than meat.

The grade of milk known as "certified" is nothing more than milk of an known composition, as clean and free from bacteria as science and skill can make it. Some of the essential points in its production are here noted.

The yard must be covered with gravel or cinders sufficiently deep to keep the cows out of the mud.

The stable need not be of costly construction, but it must be arranged with a view to cleanliness and the comfort of the cows. This includes cleaning the stable twice a day when the cows are in all the time, whitewashing it at least once a year, and providing an abundance of light and pure air.

Since it is during the process of milking that milk as ordinarily produced receives the greatest amount of contamination, all udders must be washed before milking and the milkers must wash their hands and put on clean suits of some washable materal.

THE CONSUMER'S RESPONSIBILITY.

That milk may reach the table in first class condition, the consumer has responsibilities as well as the producer. The milkman is frequently blamed for many things for which he is not responsible. However perfect the condition and low the temperature of the milk when delivered, it cannot remain long in good condition unless carefully treated. If milk is to keep it must be held at a low temperature, at least 60° F, and below if possible.

If milk is not delivered in bottles, care must be taken to protect it from dust and it must be placed where there are no odors to be absorbed. Bottled milk being sealed with a pulp cap, cannot absorb odors and should be left in the bottle until used, not turned into an open dish.

IMPROVING CONDITIONS.

"Certified" milk should be the only standard and it points the direction for improvement over the common methods of milk production. Most of the conditions for the production of certified milk are not expensive. With the majority of dairymen only a few call for the outlay of additional money. The most important conditions, those involving cleanliness and safety can be secured without appreciable expense; here improvement can begin and should begin at once and go forward as rapidly as possible until all milk offered for direct consumption is produced according to the standard for certified milk.

Among the reforms that can be secured at insignificant expense and which should be universally insisted upon are the following:—

To keep the cows clean and not compel or allow them to wade and live in fifth. This means clean yards and clean, well-bedded stalls. Everything short of this is positively repulsive and should not be tolerated any longer in a civilized community.

To stop the filthy practice known as "wetting the teats" by which is meant the drawing of a little milk into the hands with which to wet the teats before and during milking, leaving the excess of filthy milk to drop from the hands and teats into the pail.

To wash all utensils clean by first using luke warm water; afterwards washing in warm water and rinsing in an abundance of boiling water, then exposing until the next using in direct sunlight, which is a good sterilizer.

To use milk pails, cans, etc. for no other purpose but to hold milk.

To keep out of these utensils all sour or tainted milk, even after they have been used for the day. Using them for this purpose at any time infects them so badly that no amount of washing is likely to clean them. Bacteria are invisible, and millions can find lodging place in the thin film of moisture that remains after dishes are apparently clean.

To brush down the cobwebs and keep the barn free from accumulations of dust and trash

To whitewash the barn at least once a year.

If these changes can be brought about they will secure a comparatively clean product and the improvement will amount almost to a reformation in the milk producing business. These changes involve but insignificant expense either in money or labor, and there is no rational reason why they should not be made without delay, voluntarily if possible, by compulsion if necessary.

When the dairy and surroundings are in the best shape possible for the present, a statement should be made as to the conditions under which the milk is produced, not claiming more than is actually carried out each day. By gradually raising his standard the industrious dairyman may in time work up to the grade known as certified milk.

Improving city milk supply is a matter of educating the public to demand better milk and when the advantages of high grade milk are fully appreciated, people will be willing to pay the extra cost of production. The consuming public and the better class of dairymen are alike interested in bringing about these improvements with as little delay as possible.

NEED OF INSPECTION.

There are and doubtless always will be certain men producing milk who, from the slovenly methods they practice, are a disgrace to the dairy business. Such laws should be enacted and such a system of inspection instituted as will compel these men to be decent in their practices in handling milk, or quit the business? It is time the dairymen moved in this matter and asked for inspection. If they do not the public will soon do so and when such matters are taken in hand by those who do not have the necessary technical information on the subject, unwise methods are frequently employed. In such cases the business may be injured and injustice done to good and honest dairymen who are putting out a good grade of milk.

Producing Certified Milk. Washing Udders Before Miking.

Tuberculosis and City Milk.

ED. HOARD'S DAIRYMAN:—I enclose you a clipping from a Louisville, Ky. daily paper which I would like for you to read and then give me your opinion. I am shipping milk to Louisville, Ky. and I fear we will have to test our cows for tuberculosis. From the best information I can get this disease is not conveyed from the cow to the human system by drinking the milk. I want to be prepared in case this is demanded of us. * *

Indiana.

The "clipping" simply reports the examination by tuberculin test of the cows at one of the Kentucky state institutions, with result that numbers of them reacted to such an extent as to indicate tuberculosis. Some of the cattle are to be killed and post mortem examinations made to ascertain to what extent the disease has developed. The suggestion is made that if these post mortem examinations confirm the indications of the test, other herds will be tested and possibly regulations will be made prohibiting the selling of milk in Louisville and elsewhere from herds where the tuberculin test does not indicate the absence of tuberculosis.

Our personal opinion as to whether such a regulation would be wise is of no account. It is competent for Boards of Health or City Councils to make such regulations, because the evidence as to the communicability of tuberculosis by milk from infected cows is conflicting. But aside from this, we do not hesitate to say, that for his own protection and and profit, to save his herd from impending ruin and to promote an increased demand for the milk, no dairyman should hesitate to have his herd tuberculin tested.

In this connection read carefully the address by Hon. Mr. Edwards printed on page 939.

The Georgia Experiment Station cures pea vine hay in permanent shocks of 800 to 1000 pounds and puts hay caps on them. These need sunshiny weather and to be partly cured before being piled.

INQUIRIES AND ANSWERS.

Every inquiry must be signed with the name, Post-office and state of writer. Condence the questions into plain epecific inquiry. Be careful to note if your questions eave not been answered in replies to others. We are glad to answer all the pertinent questions that we can concerning machinery. Look over our advertising columns and write to the advertisers.

A Pennsylvania Ration.

Will you kindly formulate me a ration for my cows from wheat bran, $18.25; brown middlings, $18.75 per ton; red dog, $1.40 or $22.25 per ton; snow cream middlings, $22.25 per ton; oil cake meal, $25.00 per ton; timothy and straw for roughage. Will have some fodder corn but none to speak of. I think corn meal is about $22.50. My cows are mostly Jerseys and came fresh the latter part of summer and fall. G. W. A.

Sugar Creek, Pa.

We suspect the so-called brown middlings is nothing more than re-ground bran, with possibly an admixture of some weed seeds and mill sweepings. Just what snow cream middlings may be we cannot guess. Red-dog flour is about on a par with first-class, old-fashioned middlings, but we do not consider it or ground corn specially called for in this case, although it may be fed if circumstances seem to indicate the need of something a little heavier than bran. We suggest that this inquirer try 2 lbs. of the oil meal, commencing with less if cows are not used to it, with six lbs. bran as a daily allowance, and timothy hay and not overmuch straw, all the cows will eat with relish.

(Continued on page 952.)

Barn and Stable Plan.

For 40 Cows, 8 Horses, Calves, Swine and Poultry.

ED. HOARD'S DAIRYMAN:—I had my barn and machinery house, with contents of both, destroyed by fire the latter part of September. Loss $4,000 with an insurance of $1,250. Rebuilt silo the next week, and have it filled (about 150 tons). Have about seven acres good corn to husk. Will have to buy balance of feed for 26 cows and 4 horses. I have taken your paper for a number of years and have received a great deal of useful information from its pages.

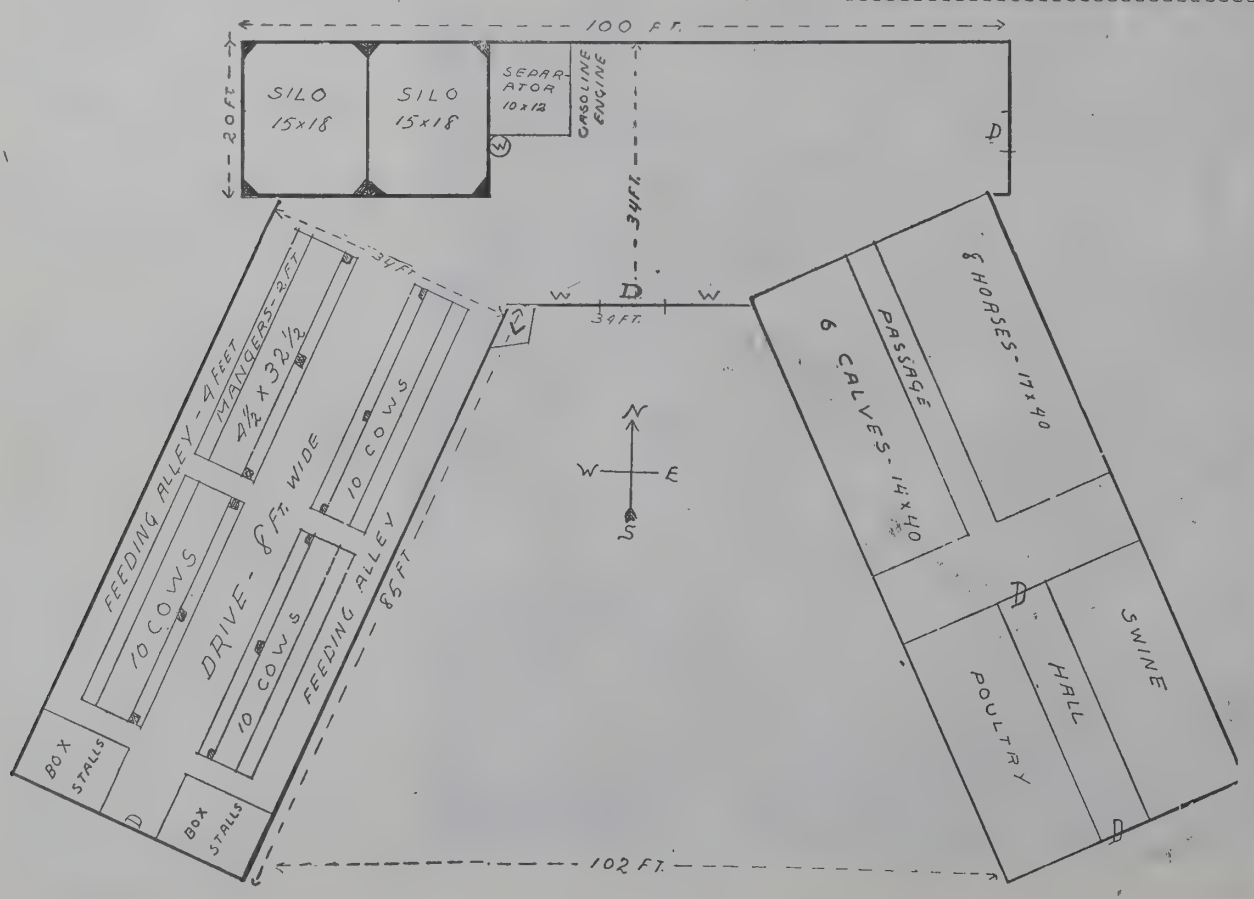
Have built a temporary stable for cows for this winter. Expect to rebuild barn next summer and want to commence getting ready this fall. Want barn large enough for 40 cows, 6 or 8 horses, calf stable, hog pens and chicken house. Want all under same roof. I also want room large enough for gas engine and cream separator.

Which would be better and cheaper, a square or round barn? I would like all the information I can get through HOARD'S DAIRYMAN. I never built a barn before. Am anxious to build a convenient barn for dairying purposes and any help you can give me on the subject will be thankfully received.

Emlenton, Pa. J. C. McCOY.

In a subsequent letter Mr. McCoy says that if he locates this barn east of, and in direct line with, dwelling, he can have a good driveway to floor above basement, with entrance facing the south, while by going 250 to 300 feet south he could have a similar entrance facing north. In his opinion the location first named would be the more convenient, but the plan we suggest does not fit in with an entrance from the south, as there would be too little opportunity for getting sufficient sunlight into the stables. Abundance of sunlight is a great desideratum, and one could well afford considerable inconvenience to obtain it.

As will be seen from the diagram, our suggestion provides for a frontage 100 feet long and 20 or more feet wide, with two diagonal wings, each 34 feet wide and 85 feet long. At first sight this may appear to be an unnecessarily large and expensive structure, but one cannot house 40 cows, 8 horses, a bull and young stock in a common sized barn. The cows alone will require at least 130 lineal feet for stall room, and this with two box stalls and the necessary passages, will take all the space afforded by one of the wings. We have marked divisions in the other wing for horses, calves, swine and poultry, but our judgment is, that it would be better to provide for the swine and poultry elsewhere, and use the space allotted to them for yearlings, colts and other young stock with one or more additional box stalls.

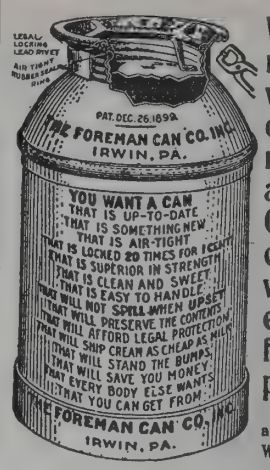


The merit of this plan, if it has any, over others which we have submitted, is that whenever the sun shines, its rays reach into the stables, but only early in the morning or late in the afternoon directly into the faces of their occupants, and by making the front or main building wider, sufficient storage room could be obtained so that the wings or stables need be only one story in height.

The gasoline engine is so located that it can easily be connected, not only with the separator, but with a pump, a grinding mill, and with the silage cutter placed in front of the division between the silos, where the carrier can be arranged to deliver the silage into either pit, and thus avoid the necessity for moving the heavy machinery.

Half of the basement under the main building is not subdivided on the plan, but can be profitably utilized for various purposes. We have marked a door on the east end, where one may drive in and out, and if not needed for other purposes this vacant space may be used for storage of vehicles of all kinds. If this entrance would fit in more conveniently with other buildings when located on the west end, it will be an easy matter to transpose the wings and locate the silos in the opposite end.

A THOUGHT ON MOTHERHOOD.



There is a good deal more to this thing of dairying than the mere selfish calculating side of cow and cash. And, let us

The Best Cow

you ever owned would be a better cow both in general condition and milk yield if fed a regular ration of

Alma Dried-Molasses Beet-Pulp

When pasture is insufficient or altogether lacking this Food supplies just the needed elements to maintain the maximum yield of milk. It is better than bran and costs less.

Let us send you our printed matter which tells how careful we are to have it proportioned just right and absolutely clean. See, too, what others think about it.

Alma Dried-Molasses Beet-Pulp is unlike many patent "stock-foods." It is a natural product and contains no drugs or other injurious ingredients.

Sanitary Milk Co., Grand Rapids, Mich., writes: "Send a second carload. We find it as a milk producer better than bran."

If you are feeding stock for the market you will find **Alma Dried-Molasses Beet-Pulp** fed with grain the best fattener, because it increases the appetite, aids digestion and assimilation.

Do not confuse this with wet beet pulp which freezes and ferments, or with common dried pulp containing no additional sugar. It takes 16 tons of wet pulp to make one ton of our Food and it keeps indefinitely. The genuine Alma Dried Molasses Beet Pulp contains 72 times as much sugar as wet pulp, and nearly 5 times as much as common dried pulp.

Write to-day for prices, directions for feeding, analysis by U. S. Government expert, etc. Address

Dept. 6, Alma Sugar Company.
Alma, Michigan.

Christmas Presents For All

Christmas time is spending time. Jolly old St. Nick can successfully manipulate the key to our purses when all other attempts fail.

Let us suggest the advisability of buying all your Christmas presents from the largest and most reliable stock in the world selling direct to the user and saving you the jobbers', dealers' and agents' profits.

Our prices are always the same — the lowest. We cannot take advantage of the liberal Christmas spirit and advance our prices as some do, for our regular catalogue figures must stand for all seasons.

We can send you everything you want in one shipment, saving you endless effort and delay in buying from several sources.

By purchasing your entire Christmas needs from us we believe you will save almost one-third of the regular Christmas prices you would pay elsewhere.

It is easy to order from our 1128-page Catalogue No. 72, with fine pictures of the articles you desire, and you can do it all in one evening with scarcely any effort.

Once your order is mailed you need not think of it again until you get the goods, for we will take care of it promptly and carefully, guaranteeing safe delivery and perfect satisfaction.

Your neighbors who know will tell you it is a pleasure to deal with us.

We mention here a few suggestions, all taken from our Catalogue No. 72.

Thousands of other desirable presents for every member of the family, from the hired man down to the baby.

If you have never seen our big catalogue you have missed a great treat. It's never too late to begin, however. Fill in the coupon and mail to us to-day. Don't wait until it is too late to get your goods before Christmas. Although the catalogue costs us almost one dollar each, we make no charge for it, only asking you to send 15 cents to bear part of the postage expense of sending it.

For Men:

Pair of slippers.
Smoking jacket.
Smoking set.
Half dozen dress shirts.
Half dozen colored shirts.
Silk umbrella.

say here, that the man who looks at it from the larger, more humane side will be rewarded by the poetic justice of a better cow and more cash. But human selfishness in its cold, dark calculations very often defeats itself. The old Bible, so wonderfully right in its views of life, carries this thought when it says:—"The merciful man is merciful to his beast." And in another place we read the old Levitical law:—"Thou shalt not muzzle the ox that treadeth out the corn."

But the sum of all this doctrine, when applied to practical affairs, is contained in that wonderfully true passage:—"The liberal man deviseth liberal things, and by liberal things shall he stand." The dairy farmer must make way for such thoughts. He of all other men cannot afford to be blind to the merciful, humane side of life, for of this is the kingdom of successful dairying. He is constantly dealing with the order of *Mammalia*, and as has been said: That is most distinctively the order of motherhood." The following from Henry Drummond is worthy the thought and consideration of every dairy farmer:

"Watch any higher animal at that most critical of all hours—for itself and for its species—the hour when it gives birth to another creature like itself. Pass over the purely physiological processes of birth; observe the behaviour of the animal-mother in the presence of the new and helpless life which palpitates before her. There it lies, trembling in the balance between life and death. Hunger tortures it; cold threatens it; danger besets it; its blind existence hangs by a thread. There is the opportunity of Evolution. There is an opening appointed in the physical order for introduction of the moral order. If there is more in Nature than the selfish Struggle for Life, the secret can now be told. Hitherto the world belonged to the Food-seeker, Self-seeker, the Struggle for Life, the Father. Now is the hour of the Mother, and animal though she be, she rises to her task. And that hour, as she ministers to her young, becomes to her, and to the world, the hour of its holiest birth."

Churning Whole Milk.

ED. HOARD'S DAIRYMAN:—Will you please tell me if I can churn a milking fresh from the cow and obtain the full amount of butter by the process? I mean, of course, the same amount of butter that could be obtained if the milk had been run through a separator.

Would the process of obtaining butter in this way take any longer than in the ordinary way? WM. M. U.

Oconto, Wis.

Churning whole milk is an exceedingly wasteful method of obtaining butter. Not only is there a large percent of fat left in the buttermilk, one per cent is not uncommon, but there is 5 times as much buttermilk as when cream is churned, which would also increase the loss of fat. Consequently churning the whole milk is one of the lost arts in dairying.

A Maryland Ration—Cotton Seed Meal and Abortion.

Will you please give me a balanced ration of the following feeds; want to feed so as to get most cream I can; have silage and shredded corn stover; corn, 45 to 50 cents per bushel; bran, $21 per ton; cotton seed meal, $1.50 per hundred. Size of cows from 600 to 1,000 lbs. each; all grade Jerseys and Durhams.

Also how much cotton seed meal does it take to make cows slip calves, or will it do it?

Frederick, Md. L. B. H.

For the smaller cows, unless they are heavy milkers, try the following:

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
40 lbs. silage	10.66	.52	5.60	.28
10 lbs. stover	5.95	.17	3.24	.07
2 lbs. cotton seed meal	1.86	.74	.34	.17
4 lbs. bran	3.52	.50	1 54	.12
Total	21.99	1.93	10.72	.64

Or, if the cows refuse to eat so much roughage, add, say, 2 lbs. ground corn. For the larger cows, if in full flow of milk, add some ground corn to the above formula.

And do not forget salt every day, either where the cows can have access to it at will, or a large teaspoonful night and morning.

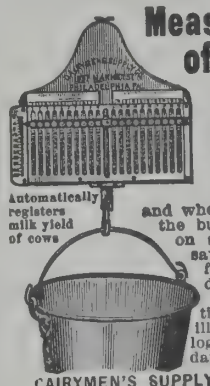
Cotton seed meal in any reasonable amount is not considered provocative of abortion, but with cows inclined that way, we should use cotton seed meal very sparingly if at all.

Rye Protegran.

You will please give feeding value of Rye Protegran as a feed for dairy cows at $17.25 per ton and would it be cheaper than Buffalo gluten at $24.00. C. T. F.

Minerva, Ohio.

"Rye Protegran" is a new name in feed stuffs nomenclature. The etymology of the term suggests that it may be dried distillers grains from rye. It is probably a good feed, but we would insist upon a guaranteed analysis from the seller. If it contains 20 per cent of crude protein it is about on a par with gluten feed at the prices named.



We would like to talk to you just a few seconds on the value of the telephone to the farmer. Possibly you know its worth already, but would like to know more about the right kind to buy. If you buy a

Stromberg-Carlson Telephone

you can't go wrong. Send five 2-cent stamps for our 128-page telephone book for the man that wants to know ALL. Or send for free book F-15 "Telephone Facts for Farmers." Address nearest office.

New Hampshire Dairymen's Meeting.

The Nineteenth Annual Meeting of the Granite State Dairymen's Association will be held in connection with the Annual Winter Meeting of the State Board of Agriculture at City Hall, Keene, Dec. 1, 2 and 3, 1903. Reduced railroad rates from all parts of the state will be in effect and a most successful meeting seems assured.

PROGRAM.

TUESDAY, DEC. 1, 11 A. M,

Invocation - - Rev. F. P. Drew, Keene
Address of Welcome - - - - - Hon. James F. Taft, Mayor of Keene
Response and Address - Hon. Joseph B Walker, - Chairman State Board of Agriculture
Address, Wood Industries of Cheshire County as Effected by Forestry Movements - - - - Robert E. Faulkner, Keene

AFTERNOON SESSION, 2 O'CLOCK

Address - - Agricultural Education
Wm. D. Gibbs, Durham, President College - of Agriculture and Mechanic Arts
Address - - Adulteration of Foods - H. E. Barnard, Concord, State Chemist
Address - The Farmer's Duty as a Citizen
Hon. J. H. Bringham, Washington, D. C., - - Assistant Secretary of Agriculture.
Address - Agriculture in the Public Schools
Dr. A. C. True, Washington D. C. Director - - - - - of Experiment Stations
Address - - - Birds on the Farm
Prof. E. H. Forbush, Concord, Mass, Ornithologist Mass. Board of Agriculture
Address - - - - Rural Development - - Governor Nahum J. Bachelder

WEDNESDAY, DECEMBER 2.

President's Annual Address - - - - James L. Gerrish L. Contocook
Address - - The Red Polled Cattle - - - George H. Wadleigh, Tilton
Address - - - Silos and Silage - - - Prof. F. W. Taylor, Durham
Address - - Cheese Making on the Farm - - - Mrs. Nathan B, Cox, Ashland
Address, The Formation of a Profitable Dairy Herd - Arthur B. Hough, Lebanon
Address - A New Profession for Women
Miss Annie F. Burbank, Graduate Department Household Arts, Framingham, Mass
Address, A Comparison of the Dairy Methods of the United States and Europe - - - - Instructor Ivan C. Weld, Durham
Address - Requirements of Modern Dairying - Professor John W. Decker, Columbus, Ohio

SECOND ANNUAL BANQUET AT THE CHESHIRE HOUSE, 8 O'CLOCK.

Ex-Mayor Horatio Colany, Toastmaster.

His Honor, Mayor H. F. Taft of Keene, His Excellency, Governor Nahum J. Bachelder, President William D. Gibbs of the New Hampshire College, and other distinguished speakers have accepted invitations to participate in the exercises.

THURSDAY, DEC. 3, 9 A. M.

Address - - - - - - Dairying
Truman Gilson, Berkshire Park Farm - - - - - - - - Pembroke
Address - Feed and Care of a Dairy Cow - - - Prof. E. L, Shaw, Durham
Address, The Development of the Retail Milk Trade, W. D. Hayden, Middlebrook Farm - - - - - - - - - Dover
Address - - Dairy Insurance Policies
Prof, J. L. Hills Director Experiment Station - - - - - Burlington, Vt

Business Session, 12.45 p. m.

There is a large premium list for details of which address the secretary I. C. Weld Durham N. H.

A Grass Report from Mr. Clark.

ED. HOARD'S DAIRYMAN:—Below please find report of my second and third grass crop, together with a total crop for this year as compared with the crop of 1902. My total second crop, 1903, from 14⅝ acres was 66,212 lbs.

3½ acres, not well cultivated, produced only 2,100 lbs., 600 lbs. per acre.
2¾ acres, produced 18,900 lbs., 6,871 lbs. per acre.
⅞ acres produced 6,518 lbs., 7,732 lbs. per acre.
The balance, 7¼ acres, produced 38,690 lbs., 5,338 lbs. per acre.

First crop 1903 was ..... 110,729 lbs.
Second crop 1903 was ..... 66,211 lbs.
Third crop 1903 was ..... 1.750 lbs.

Total, first, second and third crops, 178,690 lbs.

Average 12,218 lbs., which was an average of 951 pounds per acre more than 1902 crop, which was 164,794 lbs., averge per acre 11,268 pounds.

The total crop from ⅞ of an acre in 14 years, first and second crop, one seeding, 114 tons, 428 pounds. The surface of this field to start with had little, if any, vegetable matter upon it, nothing but clay, gravel hardpan. First, it was intensely cultivated, nothing but bone, potash and nitrate of soda has been used from the start for fertilizer, at a total cost not exceeding $250 in the 14 years, or less than $2.25 per ton of hay gathered.

The seeding was 14 quarts of timothy and 14 quarts of re-cleaned red top per acre. The crop this year has the same relative amount of timothy and red top as when originally sown. Some of it will be shown at the St. Louis Fair next year, There will also be shown samples from other parts of my grass field. The most remarkable sample will be shown from a quarter-acre section where the first crop cut this year was over 4 feet in height and weighed 2,471 pounds; second crop cut this year was over 3½ feet in height weighed 2,240 pounds, making 7½ feet in height.

Each crop was fully headed and blossomed. The third crop did not blossom, but weighed 1,750 pounds, or at the rate of 3½ tons to the acre. The total weight of the three crops from this quarter acre section was 6,401 pounds, or at the rate of 25,644 pounds per acre, fertilizer cost less than $2 per ton.

A blizzard struck 8 acres of my second crop while drying and lifted tons of it into the adjoining forest; except for that I certainly should have had 40 or more tons instead of the 33 tons which I secured.

I have a hay press never used before this year but once. This year I found it necessary to press my first crop to get the second crop in the barn, which is 60x60x30 feet up to plate. The 5½ acre plum orchard still continues its phenomenal growth without fertilizers, making this year, as last, over 300 feet growth to the trees. The intense cultivation given it by the Clark's Double Action Cutaway Harrow is still doing its work and the grass crop from the same cause is giving similar results. While we had two months in the spring without any rain, yet this year's total crop, as before stated, has an average of over 6 tons to the acre, nearly 1,000 pounds gain to the acre over last year.

If your patrons will send George M. Clark, Higganum, Conn., a 2-cent stamp, they will get a circular telling how it is done. GEORGE M. CLARK.

Higganum, Conn.

He is Ahead on the Deal.

The following letter shows that it pays to keep a friend like HOARD'S DAIRYMAN close at hand for times of emergency.

ED. HOARD'S DAIRYMAN:—I saved a cow from death by milk fever a week ago through using a remedy advertised in your paper of Oct. 16th. I figure that I am about $39 ahead for this year through HOARD'S DAIRYMAN in this one instance.

Portage, Wis. E. O. R.

Slow Churning of Cream.

ED. HOARD'S DAIRYMAN:—I am an old man (74), with one cow, make butter and like to boast of quantity and quality. While able to care for her I want the best. Have had trouble last two churnings (get about 1 lb. a day); formerly 15 minutes or less was time enough, but now one hour is required.

What is the science or philosophy of churning? Is violent agitation required? Is it the idea to bring every particle of cream into contact with air? Have a thermometer and when it indicates 70° the one used in sitting room will be about 80°—about 10° difference in air. Should it be so, and if so, why?

I feed about a peck of sour apples per day, ½ morning and ½ evening. Would they affect cream so as to injure butter or require more churning? Otherwise she is fed same as when we could get butter in 10 or 15 minutes. D. F. H.

East Onondaga, N. Y.

The trouble may be due to any one of several causes. If the cow is nearing the end of her period of lactation, it would be sufficient reason for poor and slow churning. At this period the fat globule in the milk is smaller, harder and of a higher melting point than when the cow is in fresh milk.

The milk also is more viscous and the result is difficult and prolonged churning. Something may be done to help matters by washing the cream, that is by adding twice its volume of water and then running it again through the separator, or setting and allowing the cream to rise again. This washes out the albumen and makes easier churning.

In case of a single cow like the above, the physical condition of the animal may cause the difficult churning. The trouble may also come from a slight degree of ropy fermentation indicated by a want of the proper amount of acid in the cream. Which one of the above reasons is the cause for poor churning we are unable to say from the data given and the cause can only be determined by local examination.

Churning is caused by agitating the cream with sufficient violence to bring the fat globules in contact. If the temperature is correct so as to make the globules soft enough to stick together, the butter will separate and the cream will churn. If the temperature is too low and the fat globules too hard there will be no separation of butter and no churning. Air has no influence either in helping or hindering the churning, although it is claimed that air has a bad influence on the flavor of the butter.

The thermometers will register the temperature of the place where they are kept, and there is nothing strange in a difference of 10° in the temperature of the two rooms. If there is such a difference when the thermometers are side by side, one, or possibly both, may be grossly incorrect. It is not probable that the apples affect the churning, as acid silage has no such effect.

CONCERNING OUR ADVERTISERS

We are glad to call attention in this way to the steam feed cooker advertised elsewhere in this issue and made by the Purinton Mfg. Co. of Des Moines, Iowa. This is not a kettle or tank cooker, but is actually a little steam boiler, being well and durably made of sheet steel, and by means of jointed pipes can be made to cook a dozen barrels of feed without unscrewing any of the barrels. The advantages of cooked over uncooked feed need no argument from us at this time, but we are glad to emphasize the better quality of steam cooked feed. Feed prepared in this way is never burned or scorched, and consequently it is palatable to stock, and they eat and enjoy it. This boiler is useful also for many other purposes, which it is unnecessary for us to name. Now that winter is actually upou us, many who have put off buying something of this sort will be interested in this, and we hope they will write the advertiser. They make a generous offer to send out a machine on a week's free trial. This certainly shows their confidence in it. Write them today and address Purinton Mfg. Co., Dept. E., Des Moines, Ia., and mention this paper.

Prize Puzzle

Who is it?

This is a Famous President of the United States who always used

Williams' Shaving Soap.

How many bright boys and girls can tell who it is?

To any one sending us the correct name, with a two-cent stamp to cover cost of mailing, we will forward, postpaid, a most useful and ingenious pocket novelty in the shape of key ring, letter opener, paper cutter and screwdriver combined, an article that every man and boy will find many uses for every day. Handy for the chauffeur, the bicycle rider, for opening cigar boxes, watch cases, for automatic air valves, etc.

Address Dept. 10-A.

Big Success With Hogs

SOME farmers are more successful with hogs than others. The man that only gets 8 lbs. of pork out of a bushel of corn fed to hogs makes only half as much as the man that gets 17 lbs.

The American Swineherd is a specialist and the best authority on the hog industry.

Prof. Henry says that success is only obtained by concentrating all efforts upon one line.

A two-years' course in hog raising.

Teaching how to be successful.

How to secure the greatest profits.

How to get 17 lbs. of pork out of a bushel of corn and 19 lbs. from a bushel of wheat-fed hogs.

How to feed to double the growth and gain over usual methods; only healthy hogs profitable.

How to keep your hogs healthy.

How to utilize, without other expense than the subscription to this paper, the costly experience and gathered wisdom of the most capable and successful feeders

Prof. Kennedy of the Iowa Agricultural College says "Your paper is a leader in its line on feeding."

Every owner of hogs should take advantage of this special offer.

Send us $1 for two years' subscription to the **American Swineherd** and it will entitle you to a free copy of the Hand Book on "Hog Hygiene," with trade secrets, receipes, valuable information, etc. If the offer is accepted in ten days we will send you in addition the wonderfully suggestive picture in colors, "Uninvited Guests," suitable for framing, showing the pigs partaking of a meal uninvited.

This equips you for a successful hog business.

AMERICAN SWINEHERD,
535 Como Bldg., Chicago, Ill.

ILLUSTRATION

MONARCH FEED MILLS.

At this season of the year a subject of great interest to the farmer and feeder who studies economy in feeding is the feed mill. There are numerous mills advertised in agricultural papers, all making practically the same claims as to speed, capacity, ease of running, etc. Among so many the feeder may well be confused when it comes to making a choice. Without wishing to disparage any other good mill, we have chosen for our illustration one, which from every view point, seems to meet admirably farm requirements. It is the Monarch, manufactured by Sprout, Waldron & Co., of Muncy, Pa. It has speed, capacity, strength and lasting qualities. It grinds coarse, medium or fine, just as desired. It is alike perfectly at home in the matter of making a fine article of meal for household purposes, and for the grinding of ear corn, shelled corn, and all the feed grains either singly or mixed, for chop feed. These Monarch mills are either of the attrition pattern or are made of the famous French burr stone, than which there is nothing better for the purpose in the world. We cannot go into detailed description. The manufacturers publish an elegant catalog which shows its strong points in striking fashion. It is sold freely upon fifteen days' trial, the manufacturers being willing that it shall be put in competition by the buyer with any other mill on the market. We would urge the expediency of getting the Monarch catalog before placing an order anywhere. It is mailed free. The advertisement running in another column gives correct address.

Our Special Elgin Letter.

ED. HOARD'S DAIRYMAN:—The Quotation Committeee of the Elgin Board of Trade today reported the official market firm at 24 cents. The output of the Elgin district the past week was 549,300 pounds.

Fifty tubs of Maple Park were sold to C. S. Kilbourne for 24 cents.

DAIRY MARKETS.

ELGIN, Ill., Nov. 23—Butter advanced 2 cents a pound on the Board of Trade today, selling at 24 cents. Sales in the district for the week were 549,300 pounds.

CHICAGO, Ill, Nov. 23 –Butter—Firm; creameries 16@23c; dairies, 14@19c.

Cheese —Steady; Daisies, 10¼@10½c; Twins, 10c; Young Americas, 10½c.

Eggs—Firm: at mark, cases included, 23@26c.

Cattle—Choice to fancy beeves, 1,200 to 1,500 lbs. 5.45@5.60; good to choice steers, 4.95@5.40; fair to good export and shipping steers, 4.35@4.80; medium beef steers, 4.00@4.30; plain beef steers, 3.85@3.95; common to rough, 1,000 to 1,200 lbs. 3.50@3.80; good to fat heifers, 3.90@4.60; good to choice feeders, 3.25@4.15; good to plain stockers and feeders, 1.50@3.20; fair to good cows and heifers, 2.65@3.85; good cutting and fair beef cows, 2.10@2.50; common to good canning cows, 1.10@2.00; bulls poor to choice, 2.40@4.40; calves, choice to fancy 6.50@7.00; calves, common to fair, 3.00@6.25 corn fed western steers, 4.00@5.30; Texas bulls and grass steers, 2.90@3.85; fed Texas steers, fair to choice, 3.40@4.30; western range steers, 3.25@4.20.

Hogs — Good to heavy shipping, 4.35@4.50; fair to good heavy packing, 4.15@4.35; rough and common heavy mixed, 3.90@4.10; assorted light, 150 to 195 lbs., 4.30@4.40; good to choice butcher weights, 4.35@4.50; fair to choice light mixed, 4.25@4.35; thin to choice 50 to 130 b. pigs, 3.80@4.30; stags and rough lots, 2.75@4.00.

MILWAUKEE, Wis., Nov. 23—Butter—Creamery, extras, 23c; firsts, 21@21½c; seconds, 19@20c; renovated (process), 18@19c. whey, 10@12c. Dairy, fancy, 18c; lines, fresh, 15@16c; packing stock, 12@14c; grease, 5@6c.

Cheese—American full cream, new; Twins, 10@10½c; Young Americas, 10½@11c; Daisies, 11@11½c; Longhorns, 11@11½c; low grades, 7@9c. Brick, new, fancy, 10½@11c; low grades, 7@9c; Limburger—New, fancy, 10@10½c; off goods, 6@8c Swiss—Drum, choice, 12@12½c; Drum No. 2, 10@11c; block, choice, 11@11½c; block, No. 2, 9@10c.

Eggs—Strictly fresh laid, loss off, cases returned, 25c; do, at mark, cases returned, 22½@23c; storage, city, Apr. No. 1, 23c; storage, country, 20@21c; dirties and seconds, 19c; checks, 17c.

BRILLION, Wis., Nov. 12—Cheese—Sales today were: 187 Twins at 9¾c; 542 Daisies at 10⅜c; 21 cases Young Americas at 10c. The next meeting will be held Friday, Nov., 27.

APPLETON, Wis., Nov., 12—Twenty factories offered 58 Cheddars and 1,563 Twins today. Sales: 58 Cheddars at 9¼c; 175 Twins at 9⅜c; 1,313 at 9¼c, Next meeting Friday, Nov, 27, at 2 p. m.

PLYMOUTH, Wis., Nov. 17—Cheese—Thirty-nine factories offered 2,249 boxes today, of which 40 boxes of Twins and 66 Americas were passed on. The balance sold as follows: 572 Longhorns at 10⅜c; 55 at 10½c; 969 Daisies at 10¾c; 173 Twins at 9⅝c; 144 at 9¾c; 110 Americas at 9⅞c; 120 at 10c. Market slow.

FOND DU LAC, Wis., Nov. 23—Cheese market offerings, 911 boxes: sales, 159 Twins, 9½c, 233 Daisies, 10⅜c, market easy.

MUSCODA, Wis. Nov. 14—Cheese—Today 380 boxes of Twins were sold at 9c and 60 were withdrawn.

HORTONVILLE, Wis., Nov. 18—Cheese—The offerings today were 16 Cheddars and 820 Twins. Sales 590 Twins at 9¼c. Market dull.

PHILADELPHIA, Nov. 23—Butter—Firm and ½c higher; extra western creamery, 24c; nearby prints, 25c.

Cheese—Steady: fair demand; New York full creams, fancy, 11¾@12c; choice, 11½c; fair to good, 10¾@11¼c.

Eggs—Firm; good demand; fresh nearby, 32c, loss off; western, 31@32c; southwestern, 29@30c; southern, 27@28c.

ST. LOUIS, Nov. 23— Butter—Steady; creamery, 18@23c; dairy, 13@18c.

Eggs—Firm, 26c loss off.

KANSAS CITY, Nov. 23.—Eggs—Firm; Missouri and Kansas, cases returned, 24½c; new, No. 2 whitewood cases included, 25c.

Butter—Creamery, 19@21c; dairy, fancy, 18c.

WASHINGTON, D. C., Nov. 23—Butter—Market very firm; extras, 23½c; firsts, 22½c; renovated, 17c.

NEWARK, N. J., Nov. 23—Butter—Extras, 24c.

Eggs—Fresh extra, 34c; refrigerator firsts 25c.

NEW YORK, Nov. 23—Butter—Recipts, 5,361 pkgs.; firm; extra, creamery, 24c; creamery, common to choice, 16@23½c; state dairy, 15@20c.

Cheese—Receipts, 2,087 boxes; irregular; state full cream, fancy, small, colored, September, 12c; late made, 10½c; small, white, September, 12c; late made, 10½c; large, colored, September, 12c; late made, 10½c; large, white, September, 12c; late made, 10½c.

Eggs—Receipts, 6,269 cases; firm; state and Pennsylvania, average finest, 34@35c; state and Pennsylvania, seconds to firsts, 29@33c; western extras, 34c; western, seconds to firsts, 29@33c; western thirds, 26@28c; refrigerated 21@25c.

BOSTON, Mass., Nov. 23—Butter trade was light today, but the feeling is firm. Eggs were advanced sharply, western sharing in the gains. Quotations: Butter—Creamery, western extra, 22@22½c; western firsts, 20@21c; dairy, 15@21c; imitation creamery, 16c; ladle, 14@15½c; box and print 16@24c.

Cheese—Choice, 11@11½c; Wisconsin Twins, 11@11½c; Ohio flat, 10½c.

Eggs—Nearby, 45c; western selected, 28@34c; poor to fair, 22@26c; refrigerator, 23@25c.

NEW ORLEANS, La., Nov. 23—Butter—Extras, 23½@24½c; ladles, 16c; renovated, 18c.

TOPEKA, Kan., Nov. 21—Butter—Creamery butter, 22@23c; Dairy butter, 17@18c.

Cheese—Longhorns, 11½c; Twins, 11¼c; Prints, 12¼c.

LIVERPOOL, Nov. 21—Butter—Good United States nominal. Cheese American finest white, quiet, 52s; do colored, steady, 54s.

UTICA, N. Y., Nov. 16—Cheese—The sales here today were as follows: 49 lots 3,233 boxes.

Ruling on large and general 9¾c; ruling on small 10c. On curb 500 large and small, 10⅛c. Butter 30 pks. 22c, 500 prints 23c. October cheese sold out. Only one more market day this season.

WATERTOWN, N. Y., Nov. 21—Cheese—Sales, 2,000, at 9⅛@9⅝c for large; 9¾c@10c for small; 9½c for Twins.

CANTON, N. Y., Nov. 22—Cheese—Offered 1,397 boxes of Twin cheese, and 923 tubs of butter. Cheese sold at 9½c; butter no sales, 21c offered.

NEW YORK MARKET.

NEW YORK, Nov. 21—Butter—Receipts for the week, 27,001 packages. Exports for the week, 400 packages.

Prices for fancy fresh Creamery have ruled steady all the week, and at the close there is a scarcity of this style of butter and every indication of higher prices before the New Year.

After leaving the extreme top quality, trade is dull, prices irregular, and supply of all kinds abundant. We quote:

Creamery, fresh, extra, 23½c; medium, 21@23c; poor, 15@20c; creamery, freezer, extra, 22c; medium, 19@21c; poor, 15@18c. Dairy, extra, 21@22c; medium, 17@20c; poor, 14@18c.

Cheese—Receipts for the week, 31,354 boxes. Exports for the week, 1,928 boxes.

Home trade bought some parcels of fancy September small cheese at 11¾ to 12c. and best October makes at 11 to 11½c. Trade, however, was quite moderate, and prices always favoring buyers. Skimmed Cheese were salable to exporters at 7 to 8½c, for best, and down to 3 to 5c for poor to good, but ignored full creams entirely. We puote:

Full cream, Sept. extra, 12c; medium, 11@11¾c; poor, 10@10½c. Full cream, Nov., extra, 11@11½c; medium, 9@10½c; poor, 7@8c.

Eggs—Receipts for the week, 30,014 cases.

Market was excited and prices much higher; at the close there were no new laid eggs in sight, and extreme b'ds failed to produce the stock. Refrigerators were in demand and good stock was decidedly higher. We quote:

New York & Pennsylvania, new laid, per doz., 33@38c; Northern & Western, new laid, 34@35c; all sections, poor to good, 25@33c; refrigerator, poor to fancy, 20@26c.

177 Chambers St. DAVID W. LEWIS & CO.

BALTIMORE MARKET.

BALTIMORE, Nov. 19.—Butter—There is no quotable change to note in the condition of the butter market so far this week. A continued scarcity of all grades suitable for table purposes still prevails, and it would not be at all surprising to see higher prices for this kind ere long; butmany are of the opinion that any material advance would prove detrimental. Owing to the shrinkage in the current receipts, choice to fancy freezer stock has been in fairly active demand. Imitations of desirable quality are in good request. Ladles, when quality is satisfactory, meet with prompt sale, while defective stock is very dull and prices irregular. Rolls—All fresh sweet nicely handled stock is in good demand. Packing stock is in falr supply and moderate request. Prints and Blocks—Choice to fancy invoices meet ready sale, The market generally closes in good shape and rules firm on all attractive offerings.

Creamery separator, extras, 23@23½c; firsts, 21½@22½c; seconds, 19@21c: imitation creamery, extras, 19@20c; firsts, 17@18c; seconds, 15@16c, Iowa & N. W. Ladle, extras 16c., firsts, 15c; seconds; 13@14c; creamery blocks (2 lbs.) extras, 24c; firsts, 22½@23½c; seconds, 20@22c; prints, (½ lbs.), extra, 25c; first, 23½@24½c; seconds, 20@22c; Md, Va. & Penna. prints, extras, 24c; firsts, 22@23c; seconds, 18@20c.

Eggs.—While the receipts since our last issue show somewhat of a falling off as compared with the week previous, they are equally as large if not larger than they were a year ago. The demand for strictly fancy eggs continues very good at 29c and the market is kept quite bare of stock of this kind; mixed, held and fresh are not so eagerly sought after. Storage—All choice to fancy offerings meet prompt sale,

READING NOTICES

All Reading Notices under this head are at the rate of 25 cents per line.

For Sale—Jerseys, 7 registered heifers and 3 registered bulls, from 3 to 10 months old. Solid color. St. Lambert strains. J. ALDUS HERR, Lancaster, Pa. 42-3

Jersey Bull For Sale—Dam's recorded test is 17 lbs. 4½ ozs. He is a grandson of Landseer's Fancy 29 lbs. ½ oz. in 7 days, 936 lbs. in 1 year. Has won four 1st premiums. Write for description and price. Also two half grown Collies. J. BLACK, Bremen, O. 42-tf

Ayrshires For Sale—I have for sale two excellently bred, registered, yearling Ayrshire bulls ready for service. Price very reasonable. EDW. FINN, Whitewater, Wis. 42-2

ONLY REGULAR AWARD, CHICAGO, 1893—GRAND PRIZE, PARIS, 1900—ONLY GOLD MEDAL, BUFFALO, 190:

1903 Butter Champions.

The great 1903 national educational and championship buttermaking contest, conducted by the National Buttermakers' Association, starting in January with 429 contestants, has just been concluded, with the Championship Honors going to A. M. Sondergaard of Hutchinson, Minn., with an average score of 96.75, while second highest honors go to John Sollie of New Sweden, Minn., who was the National Champion in 1902, this time with a score of 96.66.

It need hardly be added that both Mr. Sondergaard and Mr. Sollie are users of and made their Prize Winning Butter with

De Laval Cream Separators

From Iowa comes telegraphic advices that at the State Dairymen's Association meeting just held at Waterloo, highest score of 98, with Silver Cup, goes to W. S. Smarzo, Masonville, Iowa, using an "ALPHA-DE LAVAL" Power machine, and second score of 97½, with Silver Cup, to the Dubuque Butter & Milk Company, Dubuque, Iowa, using cream from DE LAVAL Farm machines.

It has been demonstrated over and over again, in every country in the world, that while good butter can no doubt be made without a DE LAVAL cream separator, the same maker can, under the same conditions, produce a higher and better grade of butter with the help of a

De Laval Cream Separator

than is possible in any other way.

This is one of the differences between separators and one of the reasons for the overwhelming supremacy of the DE LAVAL machines, which a DE LAVAL catalogue—to be had for the asking,—will help to make plain.

At a Bargain—Two Holstein-Friesian Bulls, both registered; one ready for service, the other six months old. Both are fine calves and will sell at a bargain to make room for winter cows. S. I. TATHAM, Licking Co., Outville, Ohio. 40-3

Milch Cows—For sale 23 head of good healthy cows at reasonable prices. Jersey blood. On Big Four 26 miles from St. Louis. H. E. DORSEY, Moro, Madison Co., Ill. 41-3

For Sale or Rent—Dairy farm of 200 acres, 90 improved. $1.50 per hundred for milk year around. Address J. P. SOUTHARD, Harbor Springs, Mich. 42-10

Wanted—Experienced man to manage profitably a southern dairy of seventy-five cows. Must assist with milking. Married man preferred. Address Dr. J. H. ELLIS, Kentwood, La.

For Sale—Three young pure bred Jersey Bulls ready for service. Prices reasonable. EDWARD O. RICE, Portage, Wis. 42-3

Wanted—Single man, good milker, to work in modern dairy. State wages. Write A. H. BARROW, Roodhouse, Ill.

For Sale—One registered Shropshire ram, good form and size. Address THOMAS TOMPKINS, Kendall, Wis.

Guernseys—For Sale—A Thrifty Young Bull, dropped Sept. 1902, good in type and color, well bred, ready for service. Also a grandson of Sheet Anchor, dam has given 40 lbs. milk per day, dropped June 8, 1903; a remarkably large and fine animal. Also bull calf dropped Oct. 1, 1903, out of a 400 lb. cow by a bull tracing to Mibia's Vesta-Fantine 2d, and Champion Sweet Briar 3d. R. H. WARDER, North Bend, O.

If You Contemplate investing in choice Southern California land, from ten acres up, for Dairying, Alfalfa, Fruit or Vineyards, write to DAVE BRADBEER, Norwalk, California.

For Sale—I have some first-class Belt and Steam Power Separators which I would like to exchange for a No. 1 or 2 Alpha De Laval Belt Power Separator. I have Reid's, Springer's, Sharples' Tubular, Imperial Russian, Barber Overflow, Danish Weston & Co. Also separator frames and jacks. F. M. PARKHURST, Corry, Erie Co., Pa., R. F. D. 10. 42-4

Two choice young Guernsey bulls for sale. MRS. A. W. LEHMANN, Neosha, Dodge Co., Wis. 12-sp

Wanted—A man to manage a dairy and farm of two hundred acres. Good milk route, complete outfit of stables, silo, milk room and water supply, most conveniently arranged. Adjoining city limits. Applicant must have some capital and satisfactory references. Address R. E. D., care Hoard's Dairyman.

Wanted—Position as manager of produce company. 21 years experience as buyer of butter, eggs and poultry. Also large experience with establishing creameries under the hand separator system. LOCK BOX 74, Alma, Mich.

Wanted—Good all around man with good habits, on dairy farm. Married or single. Good wages. FRANK A. SHOWERMAN, Agricultural College, Mich. 42-2

For Sale—Two fine dairy farms, vicinity of Washington City. Electric R. R. through one and near the other. For particulars address owner. L. E. WATT, 745 7th St., S. E., Washington, D. C. 39-4

For Sale—Five cheese factories, 20 acres landsaloon and store with stock, three houses in Appleton, Wis., two farms 60 and 80 acres. Address 775 Ida St., Appleton, Wis. 36-tf

Wanted—Experienced butter maker, former instructor in dairying, at present in charge of sanitary milk bottling plant in eastern city, wishes to change position. Address C., care of HOARD'S DAIRYMAN, Fort Atkinson, Wis. 38-5

The Third Revised Edition of Buff Jersey's Popular Book Just Out of Press—Ten chapters, 25 illustrations and right up-to-date. Subjects treated are: Silos and Ensilage, All Phases of the Dairy Subject, Soil Crops, Up-to-date Farm Machinery, How to Cure Abortion and Milk Fever, Some Medicines and Remedies, The Steam Plant, its care, and many other valuabe things ably treated. Send for circular. Sent post paid, cloth binding $1.00, paper 75c. BUFF JERSEY, Monmouth, Ill. 47-tf

For Sale—A cheese factory in good dairy country, doing good business. No opposition, (cheap.) Address S. O. U., care Hoard's Driryman. 34-tf

For Sale—Two registered yearling Guernsey bulls. RAY BICKNELL, Ft. Atkinson, Wis. 32-tf

Wanted—Young or middle aged man who is, or wants to be, a practical farmer, to go on new farm just starting. Chance to take a claim joining, or near by. Also a carpenter and a blacksmith for same place. Must be temperate and industrious. Also want middle aged woman for housekeeper. References required. O. S. COWLEY, New Salem, N. D. 41-2

Creamery—In a good location for rent, or will sell cheap. A good chance for the right man. Apply to E. L. POWELL, North Freedom, Wis. 41-2

Sale of Guernseys—Ten heifers, two year olds and under. A rare lot. Send for circular. M. SAGER, Orangeville, Pa. 41-tf

Wanted—At Meramec Highland Dairies near St. Louis, experienced milkers, also a good dairy foreman thoroughly experienced as feeder and good milker. Apply at Dairies or City Office, 208 N. 4th St., St. Louis, Mo. 41-2

Up-to-date Creamery Operator Wanted—Must have thorough knowledge of pasteurizing, use of starter, testing, etc. Reply at once and state wages, to ENUMCLAW CO-OPERATIVE CREAMERY CO., Enumclaw, Wash. 41-2

For Sale—Two yearling Jersey Bulls and three Heifers, all eligible for registry. M. C. VOSBURG, Fort Atkinson, Wis. 42-2

Very low rates to International Live Stock Exposition at Chicago—Via the North-Western Line. Excursion tickets will be sold Nov. 29, 30 and Dec. 1, limited to Dec. 7, inclusive, Apply to agents Chicago & North-Western Ry.

Excursion Tickets to St. Paul and Minneapolis and Return—Will be sold by the North-Western Line daily until Nov. 30, 1903, from Fort Atkinson at $14.00 for the round trip, limited to return until Dec. 15, 1903. Apply to agents Chicago & North-Western R'y. 35-8

Dairy Questions Answered by Prof. Farrington.

TESTING BUTTER WITH THE BABCOCK.

Please publish the means of testing butter by the Babcock test to find percentage of butter fat. What does the balance contain under every day creamery work? F. B.
Mongaup, N. Y.

The attention of a number of chemists and other people interested in dairy products has been frequently turned toward the application of the Babcock test to the testing of butter. Up to the present time no one has been able to devise a method by which the percentage of fat in butter may be satisfactorily determined by this or any other method at a creamery. Butter contains so much fat that the test bottles ordinarily used for testing cream will not measure the large percentage of fat in butter. Another reason why butter cannot be successfully tested is the difficulty there is in obtaining a small quantity of butter which will fairly represent the large amount from which it is taken; in other words, it is very hard to take a fair sample of butter.

The only way in which butter fat in butter may be satisfactorily determined, up to the present time, is to carefully take portions from different parts of the butter to be tested, mix this thoroughly in a glass jar or bottle and melt the butter while the cover is on the jar; then take this jar of melted butter and shake it violently while it is cooling. A chemist usually holds the jar under a stream of water in order to hasten the cooling while it is being shaken. In this way the butter will be thoroughly mixed so that a small portion of this sample will fairly represent the entire quantity.

When a sample has been prepared in this way, some five to ten grams of it are carefully weighed on a small dish, which is placed in an oven and heated to the temperature of boiling water until the water entirely evaporates from the butter. This butter is then weighed, the loss of weight showing how much water the butter contained. The salt and curd left in the dish after the water has been expelled are then determined and the percentage of these substances added to the water will give the constituents which butter contains beside fat; subtracting the sum of these three, water, salt and curd, from 100, gives the percentage of butter fat in the sample tested.

This is rather a long, tedious operation, but it is the only one that has proved to be satisfactory for determining the amount of fat in butter, if one desires to obtain accurate results.

Something of an idea of the amount of fat which butter contains may be obtained by placing a quantity of it in a tall, graduated cylinder. The butter is then melted by placing the cyclinder in hot water, and as the fat will rise on the surface with the salt, water and curd at the bottom of the column, the proportion which the fat is of the entire quantity of butter may be approximately determined. This is a very inaccurate way of estimating fat in butter, although it is used for giving a general impression on this point.

The balance of the butter, besides butter fat, is water, salt and curd. It is impossible for any buttermaker to mix the same amount of water and salt with each churning of butter he makes, and on account of this impossibility which no one has been able to overcome up to the present time, the fat in butter will naturally vary more or less with each churning.

An average of the analyses of 350 samples of butter made during the World's Fair in 1893, gives the following figures:

Water	11.57	per cent
Fat	84.70	" "
Curd	.95	" "
Salt and ash	2.78	" "
Butter	100.00	" "

Subtracting the fat, 84.70 per cent, from 100.00 leaves 15.30 per cent as the sum of the water, salt and curd which the butter contains.

The percentage of these constituents will vary in different kinds of butter, but it usually comes between ten and seventeen per cent. These are the substances which "the balance of the butter contains besides fat, in every day creamery work."

I did not write the book "Milk and its Products," but had a hand in writing the book, "Testing Milk and its Products." I shall be greatly obliged if you will inform me what parts of the book or what statements made therein need further discussion, as I am expecting soon to issue a new edition of it.

PATCHING A BOILER.

I wish to get some information regarding a boiler. I have one which has been in use for five years; it was covered with brick and mortar all over the top. Now we have discovered several small leaks around the dome under the brick and mortar, and these leaks have corroded the shell of the dome very badly. I would like to know if I can take the dome off of my boiler and put a patch over the hole and expect the boiler to do as good work as if it had the dome on it. If this is not advisable can I enlarge the dome hole, and put a larger dome on the boiler? Which is the better method to adopt in repairing this boiler? The boiler is as good as new in all other respects? A. ERICKSON.
Volga, Wis.

The corrosion of a boiler around the brick work as mentioned is not an unusual thing, and in this case the boiler may be repaired in either of the two ways mentioned. Taking the dome off and placing a patch over the hole will probably cost less than to enlarge the hole and and put on a dome larger than it had before, Boilers are now being made without domes and these can be used with good results, provided the amount of work which the boiler must do does not equal the capacity of the boiler. That is to say, if a sufficiently large steam space can be left above the water in the boiler to do the work which is desired of the boiler, the dome is unnecessary. If you are running a creamery where the work does not equal the capacity of your boiler, I think it will be better for you to take the dome off and put a patch over the hole. It will be necessary to reinforce the boiler plate at the places where the steam supply pipes are attached to it.

In case the work the boiler is now doing, or the use of the steam it makes, is nearly equal to the capacity of the boiler and there is only a small amount of steam space above the boiler flues, it will be better for you to take the dome off and put a larger one on in its place. Either one of these repairs may be easily made, and if, as you state, the boiler is in perfect condition in all other places, such repairing will probably make the boiler as good as new.

STARTING A CO-OPERATIVE CREAMERY.
SECOND INQUIRY.

Since receiving your first letter we have decided to call a meeting of all parties interested in the creamery in our locality. Some of the farmers are afraid the enterprise will meet with many obstacles. They think it will be difficult to get farmers to positively agree to send their milk or cream to a factory before the creamery has obtained recognition for good work. Several creameries have started in this neighborhood and are now remaining idle. We have never had one within twelve miles of us but five factories beyond this territory have stopped running. I do not know the reason for their making a failure of it. On account of this experience some of the farmers are afraid to start our creamery but a goodly number are talking very much in favor of it because they have learned that where factories are in operation the cow owners prosper. Our farmers think that we can agree and that there is no necessity of a jangle and a failure. We have had no experience in sending milk to a creamery and therefore need a little advice.

I fear it will be hard to get even a few of the farmers to sign a paper which will be a binding contract compelling them to keep the number of cows that they may agree to keep and I will, therefore, request that you send me either forms or some definite instructions for drawing up such a contract. We also want information

"ADVERTISEMENT."

COULDN'T FOOL HIM

Doctor Was Firm and Was Right.

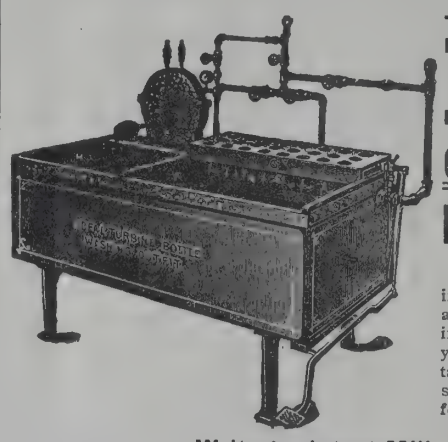
Many doctors forbid their patients to drink coffee but the patients still drink it on the sly and thus spoil all the doctor's efforts and keep themselves sick. Sometimes the doctor makes sure that the patient is not drinking coffee and there was a case of that kind in St. Paul where a business man said:

"After a very severe illness last winter which almost caused my death the doctor said Postum Food Coffee was the only thing that I could drink and he just made me quit coffee and drink Postum. My illness was caused by indigestion from the use of tea and coffee.

"The state of my stomach was so bad that it became terribly inflamed and finally resulted in a rupture. I had not drank Postum very long before my lost blood was restored and my stomach was well and strong and I have now been using Postum for almost a year. When I got up from bed after my illness I weighed 98 pounds and now my weight is 120.

"There is no doubt that Postum was the reason for this wonderful improvement and I shall never go back to tea or coffee but shall always stick to the food drink that brought me back to health and strength." Name given by Postum Co., Battle Creek, Mich.

Look in each package for a copy of the famous little book, "The Road to Wellville."



The Flavor of Good Butter

is easily destroyed by contact with foreign substances. The problem is how best to protect it for table use. Up-to-date butter makers with one accord now resort to the

Pioneer Brand Parchment Paper

for wrapping pound prints and lining boxes and tubs. **Pioneer** is not a so-called parchment. It is a pure vegetable product, without taste or smell, and seals the package from foreign smells and holds the fine flavors. Name or trade mark printed on each wrapping sheet if desired. Ask for samples and book, "Better Butter." Sent free for the asking.

The Paterson Parchment Paper Company,
37 Eighth Street, Passaic, New Jersey.

THERE AR PROBABLY MANY GOOD THINGS
THAT YOU NEED and ought to have, but don't know it.

Here is one of them:

OUR Ideal Turbine Bottle Washing Outfit

We have condensed a whole lot of good things into this outfit. Just packed them up from all around your milk depot and compressed them into one convenient piece of apparatus. Here you have washer, rinser, sprayer, and washing tanks all within easy reach. This is only one of several specialties we have in this line. Our information in this line is yours for the asking.

about the necessary articles of incorporation.

Is it a good plan to build a factory in which both butter and cheese may be made under one management?

Will the cream from cows that drink pond water be equal in value to that where they have spring, well or brook water. If not, what is the remedy?

Is the cream obtained by different processes such as hand separators, setting milk for cream to raise and that from water separators of the same value to a factory?

Can these different kinds of cream be made to harmonize and how?

The suggestions which you have made in a previous letter that five cents per hundred weight be deducted from each man's check every month in order to pay for the building and for equipping the factory, looks doubtful to me but I have never been through the experience and it may be that we can get our factory paid for in this way. If we should adopt that plan of payment what suggestions would you make to the size of shares of stock and also would all those who let us have their milk be shareholders in the creamery? Should this be mentioned in our by-laws.

Is it preferable for each stockholder to have one vote for each share of stock he owns? and is it best to limit the amount of stock each man may own? E. B. H.

Retreat, Wis.

An answer to a former letter of inquiry from these farmers has been printed in an October issue of this paper, and if they will continue their inquiries in the future we will have the history of one creamery, at least, from the beginning of the enterprise until it proves to be a success or a failure. Some of the questions asked are applicable to all creameries and cheese factories. This is especially true of the inquiry about the water supply.

Open pond water for stock is not to be recommended. When cows have access to stagnant water of any kind it is very difficult to clean them so that milking may be done in a sanitary way. The mud which sticks to their legs while walking in such places, easily finds its way into the milk pail during milking. Aside from the fact that it is very repulsive to think of pure milk being manufactured from water which cows drink from stagnant pools, the access which cows have to such places gets them in such a condition that the milk is easily contaminated by the filth which clings to them for a while and then drops into the milk bucket. The drinking of water from pond holes may not have any effect on the richness of the milk which cows produce, but it certainly will affect the purity of the milk. This is a very important factor in making a fancy dairy product of any kind as it is not possible to make either butter or cheese that will bring the highest market price unless the milk from which it is made is always clean and pure.

The remedy for such conditions is to require farmers to fence in the pond holes to which their cows have had access, and provide water for them from some other source. This may be done by digging a well and having the water pumped by wind mill, if no other source of pure water is available.

Various Kinds of Farm Cream.

The cream obtained by different processes, either by hand separators, gravity setting or water separators, may be received at the creamery and paid for according to the Babcock test. This is a matter which the creamery can control very easily by the test, because the amount of fat in each lot of cream may be determined and paid for according to the results of the test. When some patrons send milk and others cream, a slight difference in the payment of such patrons must be made in order to compensate the cream patrons for the work they have done in skimming it and for the fat left in the skim milk. This can be easily adjusted by adding three per cent to the weight of fat delivered to the factory by such cream patrons. This has been explained in another article.

Possibility of a Failure.

It may be difficult to induce farmers to continue patronizing the factory, but the success of the entire enterprise will depend largely on the amount of milk and cream delivered to the factory. If a few patrons drop out, they will lose what little they may have put into the enterprise and cause those who wish the factory to continue to lose something also, while if they will all work together and increase their herds, the creamery will grow and become a source of prosperity to all the farmers patronizing the factory.

I think it will be a good plan for someone of the patrons to visit the factories which you say have failed and find out the cause of their failure.

If you can get the milk and cream promised from three hundred cows for at least one year, I think there is no doubt but that the farmers will continue to patronize the factory the next year.

The form of agreement which farmers are usually asked to sign is a simple one. All that is necessary is to write at the top of a sheet of paper:

The undersigned hereby agree to supply the ———factory with milk from ———cows for one year or more.

Or, if you wish a more binding contract than this, consult some lawyer in your neighborhood in regard to this matter. I think, however, that if the farmers do not willingly patronize it at the start and continue their patronage, the enterprise cannot be made a success by attempting to force some of them to continue sending milk.

You first want to find out if there are enough cows in the neighborhood to support a factory and then go ahead with the enterprise with the expectation that it will succeed.

The articles of incorporation you ask for I think may be drawn up by some lawyer in your neighborhood. If the farmers prefer to draw this up themselves you can get suggestions about the methods of organizing a creamery from the book "Testing Milk and Its Products." Several pages of this book are devoted to this matter and an illustration of the constitution and by laws are also given in it.

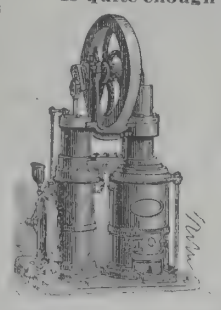
Making Both Butter and Cheese.

I think that at the beginning it will not be necessary for you to provide for making both butter and cheese in the factory. At the meeting you expect to have you may discuss this matter and decide which sort of a factory the majority of the patrons prefer to have in operation.

Raising the Funds.

The five cents per hundred weight of milk from the three hundred cows, ought to amount to quite a respectable sum per month so that it will not take very long to pay the $3,000, and interest, which is obtained for starting the enterprise. Three hundred cows ought to supply at least 5,000 pounds of milk per day and this amount of milk at five cents per hundred weight, is $2.50 a day, which will amount to about $800.00 per year. Your factory will then be paid for in about four years so that the farmers will own it, each one's share being proportional to the pounds of milk he has delivered to the factory. Of course if the milk supply goes over 5,000 pounds per day, as it certainly will if the factory is a

"GUESS who it is?" The mother knows the touch of the soft hands too well to need to guess, and for the moment she enters into the playful spirit of the child and forgets her toil and weariness. Then a sudden movement sends a thrill of pain through her and she realizes that though love may lighten labor it cannot lighten pain.



Thousands of women who have suffered from backache, headache, and other consequences of womanly disease, have been made well women by the use of Dr. Pierce's Favorite Prescription. It establishes regularity, dries unhealthy drains, heals inflammation and ulceration and cures female weakness.

"I cannot say enough in praise of Dr. Pierce's Favorite Prescription as it has done me so much good," writes Mrs. Henry Harrell, of Tarboro. N. C., Box 109. "I was swollen so I could hardly walk when I began taking the 'Favorite Prescription.' I also had uterine trouble and could neither eat nor sleep only as I took morphine. Tried four different doctors and they all failed to do me any good, so one of my friends recommended your 'Favorite Prescription' to me and I took only three bottles and am now well and hearty. Can do almost any kind of work."

Dr. Pierce's Pleasant Pellets are the most desirable laxative for delicate women.

success, the sum invested will be raised in less than four years.

The shareholders in the enterprise will include all those who have supplied the factory with milk. I think it will be preferable to allow each shareholder to cast as many votes as he owns stock in the company, rather than to have each patron equal to one vote. This is the way in which such business enterprises are usually conducted and I think it has been found to be satisfactory. I see no reason why a limit should be put on the amount of stock owned by any one patron, provided he owns cows and sends his milk to the factory and the amount of stock has come to him on account of the large supply of milk he has furnished the factory.

I think you will get a good many points of benefit to you in starting this enterprise if you will send some representative of your company to a co-operative creamery which has been successful in the past. Let him confer with the manager of such a factory and find out the method of dividing the stock among the patrons and of paying the patrons for milk that has been most successful and acceptable to the patrons of that factory.

E. H. FARRINGTON.

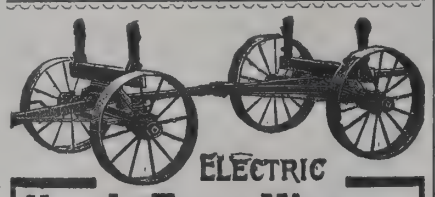
Wis. Dairy School.

The Central Maine Fair Association

ED. HOARD'S DAIRYMAN—The farmers of Kennebec, Somerset and Waldo counties assembled in adjourned meeting on the 19th inst., and completed the organization of the Central Maine Fair Association. This organization will be educational in all its departments and bearings, if its members do "not forget" the good advice received fnom the eminent speakers who held forth from the stage of the Waterville city opera house, where the meeting was called.

The state of Maine is mindful of the needs of these her children, and appropriates a part of her treasure as a school fund, for the training of the eye, ear and hand of the grown up industrial individual.

This new member of the Fair fraternity of Maine starts off with a complete and harmonious organization. All needed offices have been named and able men elected to fill the same. One of the ablest editors of central Maine was selected as president and promises a strictly business administration of the new association.



This organization has been effected with the advice and counsel of some of the most experienced managers of state and county fairs here in Maine. Then, in order to give it a better start, the organization was capped with a Farmers' Institute, and Commissioner of Agriculture, Gillman, had a faithful band of workers with him to speak on the several most important features of the fair and their management. Prof. Hurd of the State University who has had several years experience with fairs in the wilds of Michigan, has learned some things worth remembering, and gave from his ripe experience some deductions as to what to encourage and avoid in the conduct of the affairs of the new organization.

The need for full and free classification of products brought for exhibition was discussed, as was the need of securing expert judges to make awards. A judge who can make a just and scientific award and then stand by for half a day or more and explain to seekers of knowledge why he gave one first and another second prize in the competitions, is the one needed. This power of decision and explanation will be expected from the judges who will be considered the schoolmaster, or past masters, in making the awards on the products of the fields and orchards, the looms, and the work shops.

But when it comes to the byre, Prof. Phelps of Conn., raised the question of who shall be able to decide and name the points of a good cow when every college in the land is teaching a different scale and thus the agricultural college doctors are at a variance. He did, however, give a grain of comfort, when he advocated a yearly feed and milk test to determine for sure which is the best cow. No external marks or conformation can take the place of this accurate knowledge and it is impossible to replace it by a superficial examination of the exterior of the cow.

Dr. C. D. Smead, of New York, gave a very close analysis of the horse question at fairs. Dr. Smead is a middle aged man, who, coming from the Empire State, brought with him recollections coach, German or French, or draft horses, of fairs where he has been as an official and an exhibitor. He has heard what people say of the management, and, from this experience and what others have said, somehow, the audience seemed to think it had altogether the best of the case, when it learned that the earlier speakers had already used many of the words the doctor had intended to utter, and he was thrown on new resources which he brought up fluently from his varied experience with Empire state and county fairs.

This speaker has found that few successful horsemen are good judges of a horse, and if one of them can judge one class of horses, he is more than likely to default when brought into the ring with a different class, as from standard bred to

ELECTRIC

Handy Farm Wagons

make the work easier for both the man and team. The tires being wide they do not cut into the ground; the labor of loading is reduced many times, because of the short lift. They are equipped with our famous Electric Steel Wheels, either straight or stagger spokes. Wheels any height from 24 to 60 inches. White hickory axles, steel hounds. Guaranteed to carry 4000 lbs. Why not get started right by putting in one of these wagons. We make our steel wheels to fit any wagon. Write for the catalog. It is free.

For Sample Copy of Jersey Bulletin address Indianapolis, Ind.

"IT'S UP TO YOU!"

where the division should be as wide as the number of breeds which may be induced to exhibit; bearing in mind that it is all educational, and the greater the variety the better, since more people will learn more of these useful animals, if brought out for careful inspection and comparison.

The editor of the *Maine Farmer* was called on for a speech when another had failed to arrive in time for the afternoon meeting. Dr. Twitchel, who was acting secretary, then gave an address, which for completeness and closeness to the subject had not been exceeded. This gentleman has had many years of experience in conducting the affairs of the Maine State Fair and knows all the details from start to finish in fair management.

One of the prominent features which was emphasized by most of the speakers was that the fair belongs to the members—the farmers of this section. They have elected their managers now. They must support these managers and make the fair what it is expected to be, the greatest and best object lesson for improving and increasing the quality and extent of the products of Central Maine that has ever been invoked.

As an indication of some efforts which will be made and which may be of more than passing importance is that of giving to some products which are of special value to this immediate community higher rank in premium than is usually customary. For instance, this is the home of the Baldwin apple in its best estate. This should be recognized by making a distinction in premiums offered for the Baldwin over other varieties of less value in this section.

The dairy interest has many devotees in this part of Maine, and will form an important part of the coming Central Maine fair. FRANK E. EMERY.

Maine.

Veterinary Instruction at the Wisconsin Agricultural College.

Students attending the Short Course in Agriculture at the Agricultural College at Madison this winter—commencing Nov. 28—will be given practical instruction in rudimentary veterinary science. Every owner and breeder of live stock should be able to recognize disease and act as a capable nurse of sick animals. To this end students will be taught the characteristic symptoms of common ailments, the proper care, feeding and nursing of sick animals, the best methods of administering medicines, the significance of pulse, respiration, temperature, appearance of eye, countenance, hair and excreta. "First aid" lessons will be given to equip the student as an efficient and intelligent assistant to the qualified veterinary practitioner. Measures by which diseases of live stock may be prevented and human health safeguarded will be considered, together with the study of quarantine, disinfection and State sanitary police. As an intimate knowledge of animals necessitates an understanding of anatomical structure, bones, joints, tendons, and muscles will be studied and special attention given to perfect conformation, common departures therefrom, and the causes and practical detection of lameness and unsoundness. The internal organs will be studied for knowledge of the nervous system, circulation of the blood, breathing, digestion, excretion, reproduction, etc. The recognition of age as shown by the teeth will be practically taught, while the study of common irregularities of the teeth will be taken up in relation to the feeding of animals. As an aid to the study of these rudimentary branches of veterinary science, charts, illustrations, specimens, live and dead animals and a life-sized Azoux model horse will be used and explained.

INQUIRIES AND ANSWERS.

(Continued from page 943.)

Baled Alfalfa Hay.

What can baled clean alfalfa hay be bought for, and where? If a few tons of it was fed on ground where an experimental trial was to be made next year, is there any probability of the soil becoming inoculated? J. H. O.
Danville, Ky.

Baled alfalfa hay may be bought at various points in Kansas, Nebraska and Colorado. The managers of the Jersey herd at Jerseyville, Ill., which herd is to enter the breed contest at the St. Louis World's Fair, have contracted for a quantity of the third cutting of baled alfalfa, from Colorado parties. This, with corn ensilage, will constitute an important part of the roughage ration. We hardly think feeding alfalfa on the ground would inoculate the soil with alfalfa bacteria, but we have no data on this point.

A Connecticut Ration.

I am feeding ensilage twice a day, corn fairly well eared, and seven pounds of grain mixture composed of 300 lbs. bran, 100 lbs. of gluten and 100 lbs. cotton seed meal. Am not feeding any hay yet. Am making about 110 to 115 quarts of milk a day, from 14 cows, six of which are two-year-olds milking since last spring, three of the rest were fresh this fall. How near a balanced ration am I feeding, and in your opinion can I with profit feed heavier on grain. Bran, $1.15 per cwt.; gluten $1.35, and cotton seed, $1.50.
Shelton, Conn. F. B. D.

A ration, or in other words, a daily allowance, consisting of 40 lbs. silage (which is as much as any cow should be expected to eat), and 7 lbs. of the mixture above described, would contain not far from 17 lbs. of dry matter, carrying 1.9 lbs., digestible protein, 8.2 lbs. carbohydrates and 0.6 lb. fat, costing, exclusive of silage, very nearly 9 cents. Such a ration is really deficient only in dry matter and carbohydrates, and calls for something in the form of dry forage. Add this from good clover hay and we are unable to suggest a better average. By using this word "average" we mean to be understood as suggesting that certain of the cows in this herd, we can not say which ones or how many, should receive perhaps not more than half the amount of grain specified, and that others, if copious milkers, might profitably be fed as much as 10 lbs. Only the man in daily touch with the cows and their daily record of milk production is in position to apportion the amount to be fed intelligently. It is ordinarily estimated that two-thirds of the average ration is required for the simple maintenance of the animal, whether giving milk or not. What more should be fed must be governed, if one is keeping cows for profit, by what the cow is able to use in manufacturing milk from day to day. It is self-evident that when the cow is giving 30 to 40 lbs. of milk daily she will require more material than when the yield is between 10 and 20 lbs.

Chestnut Lumber for Silos.

Could I construct a good silo out of good, traight-grained chestnut timber, say 2x4. Cost of sawing and planing $7 per thousand. Please give some idea or plan how to build. G. S. H.
Stepney, Conn.

Chestnut lumber would undoubtedly make a good silo but it is impracticable to offer any sugestions about construction without information as to the probable number of animals to be fed. It is our purpose to devote considerable attention to silo construction during the late winter and spring, but just now more pressing topics demand consideration.

Cocoanut Meal, Nutrium, Linseed Meal.

Please inform me where I can find cocoanut meal, Nutrium and linseed meal. J. N
Linton, Ind.

We do not know whether cocoanut meal is kept for sale anywhere except on the Pacific coast, and the country tributary to it. Nutrium is not quoted anywhere that we can find. Linseed oil meal is for sale by all wholesale dealers in feed stuffs.

Cow Beef—Top-dressing Wheat.

Will a cow killed while giving milk, make good meat to use? If not, how would you get her dry so she could be killed soon? When would you advise to top-dress wheat with barnyard manure, in the fall or at any time during the winter or in the spring? I have rented this land for two years, and would like to get the benefit of the manure on the two crops.
Landeck, Ohio. P. H.

The quality of the meat will depend upon the condition of the cow. In any event, if the cow is in good health, the meat will be "fit" to eat, although it may not be as tender and juicy as that from a well fattened animal. At present prices, it will not be profitable to attempt to fatten a milch cow.

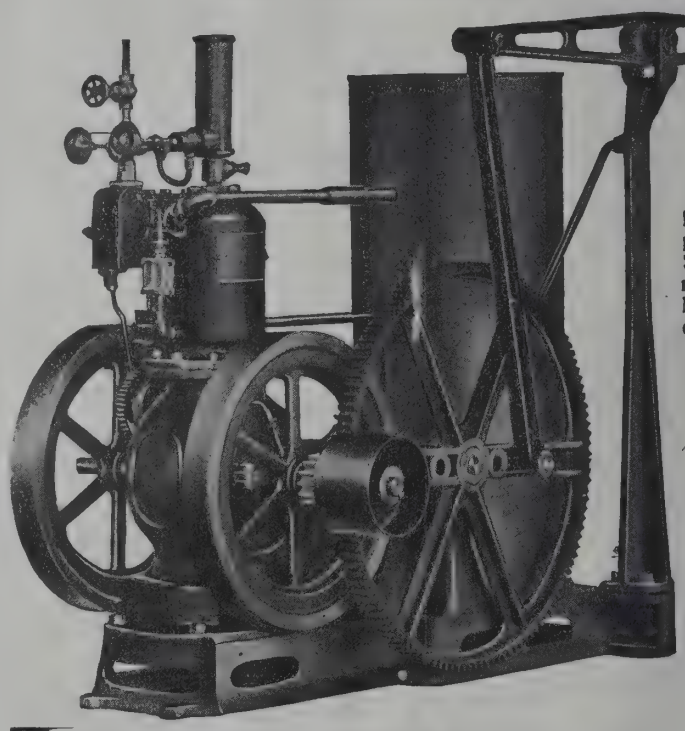
Top-dress the wheat any time when the ground is dry or frozen or covered with a light fall of snow. Be careful not to put on so much as to smother the plants, and in the spring go over the field with a harrow to break up the lumps, and secure a more even distribution.

Price of Milk—Relative Value of Butter Fat and Butter.

A milk dealer in a near by city is trying to buy milk here for the winter and offers 10 cents per gallon delivered at the depot. Is this a fair price for 4% milk at the present price for butter?
I would also like to know on what basis creameries generally buy butter fat? For instance if butter is quoted on the Elgin Board of Trade at 22 cents, what would butter fat be worth per pound? Would not the overrun pay for the manufacture of the butter?
Poplar, Wis. P. A. P.

A gallon of milk weighs 8.66 lbs. and 10 cents per gallon would be at the rate of $1.15 per 100 lbs. This is more than one could expect to receive from a creamery at the present prices of butter.

The second question is quite fully answered by Prof. Farrington on page 891



A Massachusetts Ration.

Will you please help me formulate a ration for a herd of Holsteins and Durham crosses, giving from 30 to 45 lbs. milk per day when fresh. Mixed timothy and corn stover on hand in quantity two to one. Can buy cotton seed meal at $28 per ton; spring bran, $21.50 per ton; mixed feed half bran and half middlings, $22.50 per ton; gluten feed, $27.00; linseed oil meal

The Model Gas and Gasoline Engines

Eagle 4 H. P. Stationary Engine

1904 MODEL

THIS ENGINE is of the four Cycle type and is especially designed and adapted for use on the farm—for separators, churning, pumping, elevating, hoisting, cutting ensilage, etc. No Expert or Engineer required to operate it—very simple in design and compact in construction. This engine is built so it can be easily moved from place to place. We can supply a special belt driven pumping jack to be used in connection with any pump having a wind mill head. Write for prices and description to

EAGLE BICYCLE MANUFACTURING CO.,

Engine Department. TORRINGTON, CONN.

old process, $28.00 per ton; corn meal, $23.00 per ton. J. T.
Westfield, Mass.

Where there is neither silage nor roots we think it advisable to feed some linseed oil meal, quite as much however for its dietetic effect as for its nutritive properties, although the latter are by no means of small value. We therefore incline to the opinion that about as good a selection as can be made is given in the accompanying formula.

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
15 lbs. timothy hay	13.02	.42	6.51	.21
9 " corn stover	4.76	.14	2.59	.06
2 " oil meal	1.82	.59	.65	.14
3 " gluten feed	2.70	.70	1.51	.08
4 " bran	3 52	.50	1.54	.12
Total	25.82	2.45	12.80	.61

This of course is designed for large cows giving a large yield of milk.

A Michigan Ration.

I intend to feed my cows corn fodder twice a day and mixed clover and timothy hay once a day this winter. For grain I have corn and barley and oats, but prefer not to feed my oats to my cows. Can I get the best results with these, or would it be more profitable for me to buy bran or oil meal or some of the feed stuffs advertised in the papers to make a balanced ration? If so, which would be the most profitable for me to buy and how much of each should I feed? Which is the more profitable to buy for cows, linseed oil meal or linseed meal?
Davis, Mich. B. S.

Prof. Haecker's experience in Minnesota is that a mixture of corn, barley and oats makes a satisfactory addition to a ration where one has silage, fodder corn and hay for roughage. Where there is neither silage nor roots, our opinion is that a little linseed oil meal is a profitable addition to any combination of feeds, and this would be especially true if oats were omitted from the ration:

For cows not giving over 20 lbs, of milk daily, the following would be a fair daily allowance. For cows yielding more, increase the allowance of oil meal somewhat.

FORMULA FOR RATION.	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
15 lbs. corn stover	8.93	.26	4.86	.11
10 lbs. mixed hay	8 53	.48	3.96	.16
3 lbs. corn	2.67	.24	2.00	.13
3 lbs. barley	2.67	.26	1.97	.05
1 lb. oil meal	.91	.29	.33	.07
Totals	23.71	1.53	13.12	.52

Add also a heaping teaspoonful of salt twice a day.

A New Hampshire Ration.

In looking over your feeding table analyses of October 9th, I see that a hundred lbs. of green oat fodder is worth about 200 lbs. of peas and oats; is there enough water in these peas and oats to make this difference? How would this do for a ration for cows: 40 lbs. ensilage, 10 lbs. pea and oat hay, 5 lbs. bran? C. P. O.
Lyman, N. H.

The figures in the table referred to are as we find them in the books. We should not think there would be so much difference, but have no data that would warrent us in changing them.

The ration given would tabulate as follows:

	Dry Matter.	Digestible Nutrients		
		Protein.	Carbohydrates	Ether Extract
40 lbs. silage	10.56	.52	5.60	.28
10 lbs. oat and pea hay	8.54	.92	3.68	.12
5 lbs. bran	4 41	.63	1.93	.15
Totals	23.51	2.07	11.21	.55

This is a good ration, containing enough nutrients for a thousand-pound cow, giving 20 to 25 lbs. milk.

A Michigan Ration—Dried Molasses Beet Pulp.

Will you please formulate for use a feed ration for milch cows from the following feeds: Bran, $18; fine middlings, $21; rye, 50 cents per bushel; corn, 50 cents; mixed clover and timothy hay and corn stalks; beet pulp dried, $12. What is your opinion of dried molasses beet pulp?
Lincoln Lake, Mich. E. J. S.

With no information as to size of cows or how long they have been in milk, or their capacity for milk giving, it is only a wild guess to suggest a ration formula.

We should expect cows weighing from 900 to 1,000 pounds to eat without unnecessary waste about 15 lbs. of that mixed hay and 8 lbs. of corn stover daily, and at the prices named should be inclined to limit the grain to bran, with possibly some ground corn added. The amount to be fed may vary from 4 to 10 lbs., depending, of course, upon the ability of individual cows to respond.

We think very favorably indeed of the dried molasses beet pulp, and from the analysis given should rate it a cheap feed at the prices named. At all events it is well worthy of trial.

"ADVERTISEMENT."

LET YOUR STOMACH HAVE ITS OWN WAY

Do Not Try to Drive and Force it to Work When it is Not Able or You Will Suffer All the More

You cannot treat your stomach as some men treat a balky horse; force, drive or even starve it into doing work at which it rebels. The stomach is a patient and faithful servant and will stand much abuse and ill treatment before it "balks," but when it does you had better go slow with it and not attempt to make it work. Some people have the mistaken idea that they can make their stomachs work by starving themselves. They might cure the stomach that way, but it would take so long that they would have no use for a stomach when they got through. The sensible way out of the difficulty is to let the stomach rest if it wants to and employ a substitute to do its work.

Stuart's Dyspepsia Tablets will do the work of your stomach for you and digest your food just as your stomach used to when it was well. You can prove this by putting your food in a glass jar with one of the tablets and sufficient water and you will see the food digested in just the same time as the digestive fluids of the stomach would do it. That will satisfy your mind. Now, to satisfy both your mind and body take one of Stuart's Dyspepsia Tablets after eating—eat all and what you want—and you will feel in your mind that your food is being digested because you will feel no disturbance or weight in your stomach, in fact, you will forget all about having a stomach just as you did when you were a healthy boy or girl.

Stuart's Dyspepsia Tablets act in a natural way because they contain only the natural elements of the gastric juices and other digestive fluids of the stomach. It makes no difference what condition the stomach is in, they go right ahead of their own accord and do their work. They know their business and surrounding conditions do not influence them in the least. They thus relieve the weak stomach of all its burdens and give it its much needed rest and permit it to become strong and healthy.

Stuart's Dyspepsia Tablets are for sale by all druggists at 50 cents a box. They are so well known and their popularity is so great that a druggist would as soon think of being out of alcohol or quinine. In fact, physicians are prescribing them all over the land and if your own doctor is real honest with you, he will tell you frankly that there is nothing on earth so good for dyspepsia as Stuart's Dyspepsia Tablets.

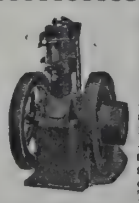
Banner Lye

(Patented)

Safety Package

Banner Lye is not old-style lye, and you can easily open our safety package and use as little or as much as you need.

Banner Lye not only keeps your kitchen, milk-room, milk-pans and dairy perfectly clean, but it makes



Pure Soap

without boiling or large kettles, and in only ten minutes.

A 10-cent can makes ten pounds of hard soap, or twenty gallons of soft soap—the best soap you ever saw or made.

Your grocer or druggist sells **Banner Lye** for 10 cents. If you send us your address, we will send you free our book *"Uses of Banner Lye."*
